[8954] Another function of GAM63 is therefore inhibition of MGC34837 (Accession NP_689590.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC34837.

[8955] MGC35338 (Accession NP_689602.1) is another GAM63 target gene, herein designated TARGET GENE. MGC35338 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC35338, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC35338 BINDING SITE, designated SEQ ID:17534, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8956] Another function of GAM63 is therefore inhibition of MGC35338 (Accession NP_689602.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35338.

[8957] MGC39518 (Accession NP_776183.1) is another GAM63 target gene, herein designated TARGET GENE. MGC39518 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by MGC39518, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC39518 BINDING SITE, designated SEQ ID:7979, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8958] Another function of GAM63 is therefore inhibition of MGC39518 (Accession NP_776183.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC39518.

[8959] MGC48935 (Accession NP_848631.1) is another GAM63 target gene, herein designated TARGET GENE. MGC48935 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC48935, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC48935 BINDING SITE, designated SEQ ID:16796, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8960] Another function of GAM63 is therefore inhibition of

MGC48935 (Accession NP_848631.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC48935.

[8961] MGC52019 (Accession NP_848593.1) is another GAM63 target gene, herein designated TARGET GENE. MGC52019 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC52019, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC52019 BINDING SITE, designated SEQ ID:5201, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8962] Another function of GAM63 is therefore inhibition of MGC52019 (Accession NP_848593.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC52019.

[8963] MIDORI (Accession NP_065829.1) is another GAM63 target gene, herein designated TARGET GENE. MIDORI BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MIDORI, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MIDORI BINDING SITE, designated SEQ ID:8948, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8964] Another function of GAM63 is therefore inhibition of MIDORI (Accession NP_065829.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIDORI.

[8965] Makorin, ring finger protein, 4 (MKRN4, Accession NP_110384.1) is another GAM63 target gene, herein designated TARGET GENE. MKRN4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MKRN4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MKRN4 BINDING SITE, designated SEQ ID:6983, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8966] Another function of GAM63 is therefore inhibition of Makorin, ring finger protein, 4 (MKRN4, Accession NP_110384.1) . Accordingly, utilities of GAM63 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with MKRN4.

[8967] Membrane metallo-endopeptidase (neutral endopeptidase, enkephalinase, calla, cd10) (MME, Accession NP_009218.1) is another GAM63 target gene, herein designated TARGET GENE. MME BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MME BINDING SITE, designated SEQ ID:9503, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8968] Another function of GAM63 is therefore inhibition of Membrane metallo-endopeptidase (neutral endopeptidase, enkephalinase, calla, cd10) (MME, Accession NP_009218.1), a gene which is thermolysin- like specificity. and therefore is associated with Acute lymphocytic leukemia. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Acute lymphocytic leukemia, and of other diseases and clinical conditions associated with MME.

[8969] The function of MME has been established by previous studies. Common acute lymphocytic leukemia antigen is an important cell surface marker in the diagnosis of human acute lymphocytic leukemia (ALL). It is present on leukemic cells of pre- B phenotype, which represent 85% of cases of ALL. CALLA is not restricted to leukemic cells, however, and is found on a variety of normal tissues. CALLA is a glycoprotein that is particularly abundant in kidney, where it is present on the brush border of proximal tubules and on glomerular epithelium. Letarte et al. (1988) cloned a cDNA coding for CALLA and showed that the amino acid sequence deduced from the cDNA sequence is identical to that of human membrane- associated neutral endopeptidase (NEP; EC 3.4.24.11), also known as enkephalinase. NEP cleaves peptides at the amino side of hydrophobic residues and inactivates several peptide hormones including glucagon, enkephalins, substance P, neurotensin, oxytocin, and bradykinin. By cDNA transfection analysis, Shipp et al. (1989) confirmed that CALLA is a functional neutral endopeptidase of the type that has previously been called enkephalinase. Barker et al. (1989) demonstrated that the CALLA gene, which encodes a 100- kD type II transmembrane glycoprotein,

exists in a single copy of greater than 45 kb which is not rearranged in malignancies expressing cell surface CALLA. D'Adamio et al. (1989) demonstrated that the CALLA gene spans more than 80 kb and is composed of 24 exons.

[8970] Animal model experiments lend further support to the function of MME. Amyloid- beta peptide (OMIM Ref. No. 104760), the pathogenic agent of Alzheimer disease (OMIM Ref. No. 104300), is a physiologic metabolite in the brain. Iwata et al. (2001) examined the role of neprilysin, a candidate amyloid- beta degrading peptidase, in the metabolism using neprilysin gene- disrupted mice. Neprilysin deficiency resulted in defects both in the degradation of exogenously administered amyloid- beta and in the metabolic suppression of the endogenous amyloid- beta levels in a gene dose- dependent manner. The regional levels of amyloid- beta in the neprilysin- deficient mouse brain were in the distinct order of hippocampus, cortex, thalamus/striatum, and cerebellum, where hippocampus has the highest level and cerebellum the lowest, correlating with the vulnerability to amyloid- beta deposition in brains of humans with Alzheimer disease. Iwata et al. (2001) concluded that even partial downregulation of neprilysin activity, which could be caused by ag-

ing, can contribute to Alzheimer disease by promoting amyloid- beta accumulation.

[8971] It is appreciated that the abovementioned animal model for MME is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[8972] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8973] Iwata, N.; Tsubuki, S.; Takaki, Y.; Shirotani, K.; Lu, B.; Gerard, N. P.; Gerard, C.; Hama, E.; Lee, H.- J.; Saido, T. C. : Metabolic regulation of brain A- beta by neprilysin. Science 292: 1550- 1552, 2001. ; and

[8974] Letarte, M.; Vera, S.; Tran, R.; Addis, J. B. L.; Onizuka, R. J.; Quackenbush, E. J.; Jongeneel, C. V.; McInnes, R. R. : Common acute lymphocytic leukemia antigen is identical to neutr.

[8975] Further studies establishing the function and utilities of MME are found in John Hopkins OMIM database record ID 120520, and in cited publications listed in Table 5, which are hereby incorporated by reference.Matrix metalloproteinase 28 (MMP28, Accession NP_116568.1) is another GAM63 target gene, herein designated TARGET GENE.

MMP28 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MMP28, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MMP28 BINDING SITE, designated SEQ ID:13641, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8976] Another function of GAM63 is therefore inhibition of Matrix metalloproteinase 28 (MMP28, Accession NP_116568.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP28.

[8977] Mitochondrial ribosomal protein s27 (MRPS27, Accession NP_055899.1) is another GAM63 target gene, herein designated TARGET GENE. MRPS27 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MRPS27, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPS27 BINDING SITE, designated SEQ ID:7135, to the nucleotide sequence of GAM63

RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8978] Another function of GAM63 is therefore inhibition of Mitochondrial ribosomal protein s27 (MRPS27, Accession NP_055899.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS27.

[8979] Membrane-spanning 4-domains, subfamily a, member 2 (fc fragment of ige, high affinity i, receptor for; beta polypeptide) (MS4A2, Accession NP_000130.1) is another GAM63 target gene, herein designated TARGET GENE. MS4A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MS4A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MS4A2 BINDING SITE, designated SEQ ID:18155, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8980] Another function of GAM63 is therefore inhibition of Membrane-spanning 4-domains, subfamily a, member 2 (fc fragment of ige, high affinity i, receptor for; beta polypeptide) (MS4A2, Accession NP_000130.1), a gene

which binds to the fc region of immunoglobulins epsilon. and therefore may be associated with Atopic asthma, atopic dermatitis. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Atopic asthma, atopic dermatitis, and of other diseases and clinical conditions associated with MS4A2.

[8981] The function of MS4A2 has been established by previous studies. Shirakawa et al. (1994) reported a significant association between atopy and substitution of a leucine for an isoleucine at position 181 of the FCER1B gene product. Hizawa et al. (1995) failed to find this leu181- to- ile substitution. Folster- Holst et al. (1998) presented evidence from linkage studies in 12 families with atopic dermatitis for linkage in close proximity to the marker D11S903. The method of analysis suggested an oligogenic mode of inheritance as well as heterogeneity in the genetic susceptibility to atopy and atopic dermatitis; only 2 of 12 families showed evidence for linkage using the oligogenic model.

[8982]

[8983] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8984] Folster- Holst, R.; Moises, H. W.; Yang, L.; Fritsch, W.; Weissenbach, J.; Christophers, E. : Linkage between atopy and the IgE high- affinity receptor gene at 11q13 in atopic dermatitis families. Hum. Genet. 102: 236- 239, 1998. ; and

[8985] Shirakawa, T.; Li, A.; Dubowitz, M.; Dekker, J. W.; Shaw, A. E.; Faux, J. A.; Ra, C.; Cookson, W. O. C. M.; Hopkin, J. M. : Association between atopy and variants of the beta sub- unit of.

[8986] Further studies establishing the function and utilities of MS4A2 are found in John Hopkins OMIM database record ID 147138, and in cited publications listed in Table 5, which are hereby incorporated by reference.Myotubularin related protein 9 (MTMR9, Accession NP_056273.2) is an- other GAM63 target gene, herein designated TARGET GENE. MTMR9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MTMR9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu- cleotide sequences of MTMR9 BINDING SITE, designated SEQ ID:10289, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8987] Another function of GAM63 is therefore inhibition of Myotubularin related protein 9 (MTMR9, Accession NP_056273.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR9.

[8988] Mucin 3b (MUC3B, Accession XP_168578.2) is another GAM63 target gene, herein designated TARGET GENE. MUC3B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MUC3B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MUC3B BINDING SITE, designated SEQ ID:12658, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8989] Another function of GAM63 is therefore inhibition of Mucin 3b (MUC3B, Accession XP_168578.2), a gene which provides a protective, lubricating barrier against particles and infectious agents at mucosal surfaces. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC3B.

[8990] The function of MUC3B has been established by previous

studies. The MUC3A gene (OMIM Ref. No. 158371), originally designated MUC3, encodes a transmembrane mucin-type glycoprotein. A number of consistent single nucleotide changes were observed in different MUC3 cDNAs from a single individual, suggesting the presence of at least 3 different transcripts. Pratt et al. (2000) presented evidence that this transcript heterogeneity is due to the existence of allelic changes and to tandem duplication of the MUC3 gene. Pratt et al. (2000) determined that the second gene, which they designated MUC3B, has the same C- terminal domain and intron- exon structure as that previously described for MUC3. The tandem repeat domain has the same amino acid consensus sequence but shows more substitutions. RT- PCR detected expression of MUC3B in fetal and adult small intestine, fetal and adult colon, and Caco- 2 cells. Kyo et al. (2001) also determined that 'MUC3' consists of 2 genes, MUC3A and MUC3B, both of which encode membrane- bound mucins with 2 epidermal growth factor- like motifs and a putative transmembrane region. Fox et al. (1992) mapped the MUC3 gene (now MUC3A and MUC3B) to chromosome 7q22 by in situ hybridization.

[8991]

[8992] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8993] Fox, M. F.; Lahbib, F.; Pratt, W.; Attwood, J.; Gum, J.; Kim, Y.; Swallow, D. M. : Regional localization of the intestinal mucin gene MUC3 to chromosome 7q22. Ann. Hum. Genet. 56: 281- 287, 1992. ; and

[8994] Kyo, K.; Muto, T.; Nagawa, H.; Lathrop, G. M.; Nakamura, Y. : Associations of distinct variants of the intestinal mucin gene MUC3A with ulcerative colitis and Crohn's disease. J. Hum. G.

[8995] Further studies establishing the function and utilities of MUC3B are found in John Hopkins OMIM database record ID 605633, and in cited publications listed in Table 5, which are hereby incorporated by reference.MYLC2PL (Accession NP_612412.1) is another GAM63 target gene, herein designated TARGET GENE. MYLC2PL BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MYLC2PL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYLC2PL BINDING SITE, designated SEQ ID:17797, to the nucleotide

sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8996] Another function of GAM63 is therefore inhibition of MYLC2PL (Accession NP_612412.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYLC2PL.

[8997] Nima (never in mitosis gene a)-related kinase 6 (NEK6, Accession NP_055212.2) is another GAM63 target gene, herein designated TARGET GENE. NEK6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NEK6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NEK6 BINDING SITE, designated SEQ ID:13237, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[8998] Another function of GAM63 is therefore inhibition of Nima (never in mitosis gene a)-related kinase 6 (NEK6, Accession NP_055212.2), a gene which regulates nuclear and cytoplasmic aspects of the mitotic cycle. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

NEK6.

[8999] The function of NEK6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Nuclear factor of kappa light polypeptide gene enhancer in b-cells inhibitor, epsilon (NFKBIE, Accession NP_004547.1) is another GAM63 target gene, herein designated TARGET GENE. NFKBIE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NFKBIE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFKBIE BINDING SITE, designated SEQ ID:16403, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9000] Another function of GAM63 is therefore inhibition of Nuclear factor of kappa light polypeptide gene enhancer in b-cells inhibitor, epsilon (NFKBIE, Accession NP_004547.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFKBIE.

[9001] NIN283 (Accession NP_115644.1) is another GAM63 target

gene, herein designated TARGET GENE. NIN283 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NIN283, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NIN283 BINDING SITE, designated SEQ ID:2207, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9002] Another function of GAM63 is therefore inhibition of NIN283 (Accession NP_115644.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIN283.

[9003] Neuronatin (NNAT, Accession NP_005377.1) is another GAM63 target gene, herein designated TARGET GENE. NNAT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NNAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NNAT BINDING SITE, designated SEQ ID:9458, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9004] Another function of GAM63 is therefore inhibition of Neuronatin (NNAT, Accession NP_005377.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NNAT.

[9005] Nuclear receptor subfamily 3, group c, member 1 (glucocorticoid receptor) (NR3C1, Accession NP_000167.1) is another GAM63 target gene, herein designated TARGET GENE. NR3C1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NR3C1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NR3C1 BINDING SITE, designated SEQ ID:10686, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9006] Another function of GAM63 is therefore inhibition of Nuclear receptor subfamily 3, group c, member 1 (glucocorticoid receptor) (NR3C1, Accession NP_000167.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR3C1.

[9007] Neurexin 1 (NRXN1, Accession NP_620072.1) is another

GAM63 target gene, herein designated TARGET GENE. NRXN1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by NRXN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NRXN1 BINDING SITE, designated SEQ ID:8566, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9008] Another function of GAM63 is therefore inhibition of Neurexin 1 (NRXN1, Accession NP_620072.1), a gene which may be involved in cell recognition, cell adhesion, and mediate intracellular signaling. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRXN1.

[9009] The function of NRXN1 has been established by previous studies. Neurexins are polymorphic cell surface proteins that are expressed in neurons. They were discovered by Ushkaryov et al. (1992) in the course of cloning the presynaptic receptor for alpha- latrotoxin. Three neurexin genes, designated 1 (NRXN1), 2 (NRXN2; 600566), and 3 (NRXN3; 600567), were identified in a rat brain cDNA library by Ushkaryov et al. (1992). Ichtchenko et al. (1995)

observed that each neurexin gene has 2 independent promoters which generate 2 classes of mRNAs: the longer mRNAs encode alpha- neurexins and the shorter mRNAs encode beta- neurexins. Thus, 6 principal neurexin isoforms, called neurexins I- alpha to III- beta, result, of which neurexin I- alpha corresponds to the high molecular weight component of the alpha- latrotoxin receptor. Ushkaryov et al. (1992) showed that rat neurexins are expressed at significant levels only in brain. Ullrich et al. (1995) found that the 6 rat neurexin isoforms are coexpressed in neurons and are distributed differentially in various brain regions. Neurexins display a remarkable evolutionarily conserved pattern of extensive alternative splicing. As a result, the total number of neurexins in brain probably exceeds 2,000 (Ullrich et al., 1995). Neurexins contain epidermal growth factor- like sequences and domains homologous to the G domain repeats of laminin A (LAMA; 150320), indicating a function in cell- cell interactions.

[9010] Animal model experiments lend further support to the function of NRXN1. Alpha- latrotoxin is a potent neurotoxin from black widow spider venom that binds to presynaptic receptors and causes massive neurotransmitter re-

lease. In rat, 2 alpha- latrotoxin receptors have been identified: neurexin I- alpha, which binds the toxin in a calcium- dependent manner, and CIRL/latrophilin, which binds in a calcium- independent manner. Geppert et al. (1998) isolated the mouse neurexin I- alpha gene and found that it contains a large first exon of more than 1.5 kb that extends to the first site of alternative splicing in the coding region. To evaluate the importance of neurexin I- alpha in alpha- latrotoxin action, Geppert et al. (1998) generated mice carrying a deletion of the first exon of the neurexin I- alpha gene. Homozygous mutant mice lacked neurexin I- alpha, although the levels of neurexin I- beta were unaffected. The mutant mice were viable and fertile, and were indistinguishable in appearance from wildtype animals. The only abnormality observed was that female knockout mice were less able to attend to litters, leading to the death of more pups independent of pup genotype. Geppert et al. (1998) found that alpha- latrotoxin binding to brain membranes from mutant mice was decreased by almost 50% compared with wildtype membranes. In cultured hippocampal neurons from mutant mice, the toxin was still capable of activating neurotransmission. However, measurements of glutamate release from synapto-

somes indicated a major decrease in the amount of release triggered by alpha- latrotoxin in the presence of calcium. The authors concluded that neurexin I- alpha is not essential for alpha- latrotoxin action but contributes to toxin action when calcium is present. They suggested that the action of alpha- latrotoxin may be mediated by independent parallel pathways.

[9011] It is appreciated that the abovementioned animal model for NRXN1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[9012] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9013] Geppert, M.; Khvotchev, M.; Krasnoperov, V.; Goda, Y.; Missler, M.; Hammer, R. E.; Ichtchenko, K.; Petrenko, A. G.; Sudhof, T. C. : Neurexin I- alpha is a major alpha- latrotoxin receptor that cooperates in alpha- latrotoxin action. J. Biol. Chem. 273: 1705- 1710, 1998. ; and

[9014] Ushkaryov, Y. A.; Petrenko, A. G.; Geppert, M.; Sudhof, T. C. : Neurexins: synaptic cell surface proteins related to the alpha- latrotoxin receptor and laminin. Science 257: 50-56, 199.

[9015] Further studies establishing the function and utilities of NRXN1 are found in John Hopkins OMIM database record ID 600565, and in cited publications listed in Table 5, which are hereby incorporated by reference.NSE2 (Accession NP_777571.1) is another GAM63 target gene, herein designated TARGET GENE. NSE2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NSE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NSE2 BINDING SITE, designated SEQ ID:5906, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9016] Another function of GAM63 is therefore inhibition of NSE2 (Accession NP_777571.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NSE2.

[9017] Netrin 4 (NTN4, Accession NP_067052.1) is another GAM63 target gene, herein designated TARGET GENE. NTN4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NTN4, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NTN4 BINDING SITE, designated SEQ ID:14085, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9018] Another function of GAM63 is therefore inhibition of Netrin 4 (NTN4, Accession NP_067052.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTN4.

[9019] Nucleoporin 54kda (NUP54, Accession NP_059122.2) is another GAM63 target gene, herein designated TARGET GENE. NUP54 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NUP54, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUP54 BINDING SITE, designated SEQ ID:6251, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9020] Another function of GAM63 is therefore inhibition of Nucleoporin 54kda (NUP54, Accession NP_059122.2) . Accordingly, utilities of GAM63 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with NUP54.

[9021] 2'-5'-oligoadenylate synthetase 3, 100kda (OAS3, Accession NP_006178.1) is another GAM63 target gene, herein designated TARGET GENE. OAS3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OAS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OAS3 BINDING SITE, designated SEQ ID:6803, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9022] Another function of GAM63 is therefore inhibition of 2'-5'-oligoadenylate synthetase 3, 100kda (OAS3, Accession NP_006178.1), a gene which may play a role in mediating resistance to virus infection, control of cell growth, differentiation, and apoptosis. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAS3.

[9023] The function of OAS3 has been established by previous studies. The 2- prime,5- prime oligoadenylate synthetases (OASs) are interferon- induced proteins characterized by their capacity to catalyze the synthesis of 2-

prime,5- prime oligomers of adenosine (2- 5As). See OAS1 (OMIM Ref. No. 164350). Hovanessian et al. (1987) found that interferon- treated human cells contain several OASs corresponding to proteins of 40 (OAS1), 46 (OAS1), 69 (OAS2; 603350), and 100 kD. Hovnanian et al. (1998) reported that the predicted OAS3, or p100, protein contains 3 adjacent OAS1- like domains. The domains share 44 to 60% protein sequence similarity with each other and 42 to 60% sequence identity with the conserved domain of OAS1. The authors noted that OAS1, OAS2, and OAS3 contain 1, 2, and 3 conserved OAS domains or units, respectively. Northern blot analysis revealed that OAS3 is expressed as a 7- kb interferon- induced mRNA in HeLa cells. By fluorescence in situ hybridization and by inclusion within mapped clones, Hovnanian et al. (1998) determined that the OAS1, OAS2, and OAS3 genes are clustered with a 130- kb region on 12q24.2.

[9024]

[9025] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9026] Hovanessian, A. G.; Laurent, A. G.; Chebath, J.; Galabru, J.; Robert, N.; Svab, J. : Identification of 69- kd and 100- kd

forms of 2- 5A synthetase in interferon- treated human cells by specific monoclonal antibodies. EMBO J. 6: 1273-1280, 1987. ; and

[9027] Hovnanian, A.; Rebouillat, D.; Mattei, M.- G.; Levy, E. R.; Marie, I.; Monaco, A. P.; Hovanessian, A. G. : The human 2- prime,5- prime- oligoadenylate synthetase locus is composed of three.

[9028] Further studies establishing the function and utilities of OAS3 are found in John Hopkins OMIM database record ID 603351, and in cited publications listed in Table 5, which are hereby incorporated by reference.8-oxoguanine dna glycosylase (OGG1, Accession NP_058212.1) is another GAM63 target gene, herein designated TARGET GENE. OGG1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OGG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OGG1 BINDING SITE, designated SEQ ID:19616, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9029] Another function of GAM63 is therefore inhibition of 8-oxoguanine dna glycosylase (OGG1, Accession

NP_058212.1), a gene which is involved in base excision DNA repair and removal of 8- oxyguanine and therefore may be associated with Tumorigenesis. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Tumorigenesis, and of other diseases and clinical conditions associated with OGG1.

[9030] The function of OGG1 has been established by previous studies. The major mutagenic base lesion in DNA caused by exposure to reactive oxygen species is 8- oxoguanine. This damaged base is excised by a DNA glycosylase with an associated lyase activity for chain cleavage. Lu et al. (1997), Aburatani et al. (1997), Bjoras et al. (1997), Rosenquist et al. (1997), Radicella et al. (1997), and Roldan- Arjona et al. (1997) cloned human cDNAs with partial sequence homology to the yeast 8- oxoguanine DNA glycosylase (OGG1) gene. Radicella et al. (1997) found that the predicted protein has 345 amino acids and a calculated molecular mass of 39 kD. Roldan- Arjona et al. (1997), who called the enzyme 8- hydroxyguanine DNA glycosylase, estimated their 424- amino acid predicted human enzyme to have a size of 47 kD. They showed that it releases free 8- hydroxyguanine from oxidized DNA and introduces a chain break in a double- stranded

oligonucleotide specifically at an 8- hydroxyguanine residue base- paired with cytosine. Expression of the human protein in a DNA repair- deficient E. coli strain partly suppressed its spontaneous mutator phenotype. Radicella et al. (1997) showed that when the human coding sequence was expressed in a yeast strain mutant in Ogg1, it was able to complement the spontaneous mutator phenotype. Arai et al. (1997) also cloned the human OGG1 gene and, by Northern blotting, showed that the gene is ubiquitously expressed in a variety of human organs. By fluorescence in situ hybridization, Roldan- Arjona et al. (1997) and Radicella et al. (1997) mapped the human OGG1 gene to 3p25 (3p25.3- p25.2). By the same method, Arai et al. (1997) mapped the OGG1 gene to 3p26.2. By radiation hybrid analysis, Ishida et al. (1999) mapped the gene to 3p26, proximal to the VHL gene (OMIM Ref. No. 193300).

[9031]

[9032] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9033] Radicella, J. P.; Dherin, C.; Desmaze, C.; Fox, M. S.; Boiteux, S. : Cloning and characterization of hOGG1, a human

homolog of the OGG1 gene of Saccharomyces cerevisiae. Proc. Nat. Acad. Sci. 94: 8010- 8015, 1997. ; and

[9034] Roldan- Arjona, T.; Wei, Y.- F.; Carter, K. C.; Klungland, A.; Anselmino, C.; Wang, R.- P.; Augustus, M.; Lindahl, T. : Molecular cloning and functional expression of a human cDNA encodin.

[9035] Further studies establishing the function and utilities of OGG1 are found in John Hopkins OMIM database record ID 601982, and in cited publications listed in Table 5, which are hereby incorporated by reference.8-oxoguanine dna glycosylase (OGG1, Accession NP_002533.1) is another GAM63 target gene, herein designated TARGET GENE. OGG1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OGG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OGG1 BINDING SITE, designated SEQ ID:19616, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9036] Another function of GAM63 is therefore inhibition of 8-oxoguanine dna glycosylase (OGG1, Accession NP_002533.1), a gene which is involved in base excision

DNA repair and removal of 8- oxyguanine and therefore may be associated with Tumorigenesis. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Tumorigenesis, and of other diseases and clinical conditions associated with OGG1.

[9037] The function of OGG1 has been established by previous studies. The major mutagenic base lesion in DNA caused by exposure to reactive oxygen species is 8- oxoguanine. This damaged base is excised by a DNA glycosylase with an associated lyase activity for chain cleavage. Lu et al. (1997), Aburatani et al. (1997), Bjoras et al. (1997), Rosenquist et al. (1997), Radicella et al. (1997), and Roldan- Arjona et al. (1997) cloned human cDNAs with partial sequence homology to the yeast 8- oxoguanine DNA glycosylase (OGG1) gene. Radicella et al. (1997) found that the predicted protein has 345 amino acids and a calculated molecular mass of 39 kD. Roldan- Arjona et al. (1997), who called the enzyme 8- hydroxyguanine DNA glycosylase, estimated their 424- amino acid predicted human enzyme to have a size of 47 kD. They showed that it releases free 8- hydroxyguanine from oxidized DNA and introduces a chain break in a double- stranded oligonucleotide specifically at an 8- hydroxyguanine

residue base- paired with cytosine. Expression of the human protein in a DNA repair- deficient E. coli strain partly suppressed its spontaneous mutator phenotype. Radicella et al. (1997) showed that when the human coding sequence was expressed in a yeast strain mutant in Ogg1, it was able to complement the spontaneous mutator phenotype. Arai et al. (1997) also cloned the human OGG1 gene and, by Northern blotting, showed that the gene is ubiquitously expressed in a variety of human organs. By fluorescence in situ hybridization, Roldan- Arjona et al. (1997) and Radicella et al. (1997) mapped the human OGG1 gene to 3p25 (3p25.3- p25.2). By the same method, Arai et al. (1997) mapped the OGG1 gene to 3p26.2. By radiation hybrid analysis, Ishida et al. (1999) mapped the gene to 3p26, proximal to the VHL gene (OMIM Ref. No. 193300).

[9038]

[9039] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9040] Radicella, J. P.; Dherin, C.; Desmaze, C.; Fox, M. S.; Boiteux, S. : Cloning and characterization of hOGG1, a human homolog of the OGG1 gene of Saccharomyces cerevisiae.

Proc. Nat. Acad. Sci. 94: 8010- 8015, 1997. ; and

[9041] Roldan- Arjona, T.; Wei, Y.- F.; Carter, K. C.; Klungland, A.; Anselmino, C.; Wang, R.- P.; Augustus, M.; Lindahl, T. : Molecular cloning and functional expression of a human cDNA encodin.

[9042] Further studies establishing the function and utilities of OGG1 are found in John Hopkins OMIM database record ID 601982, and in cited publications listed in Table 5, which are hereby incorporated by reference.Optic atrophy 3 (autosomal recessive, with chorea and spastic paraplegia) (OPA3, Accession NP_079412.1) is another GAM63 target gene, herein designated TARGET GENE. OPA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OPA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OPA3 BINDING SITE, designated SEQ ID:16306, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9043] Another function of GAM63 is therefore inhibition of Optic atrophy 3 (autosomal recessive, with chorea and spastic paraplegia) (OPA3, Accession NP_079412.1) . Accordingly,

utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPA3.

[9044] Opticin (OPTC, Accession NP_055174.1) is another GAM63 target gene, herein designated TARGET GENE. OPTC BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by OPTC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OPTC BINDING SITE, designated SEQ ID:3539, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9045] Another function of GAM63 is therefore inhibition of Opticin (OPTC, Accession NP_055174.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPTC.

[9046] Oxysterol binding protein-like 7 (OSBPL7, Accession NP_060201.3) is another GAM63 target gene, herein designated TARGET GENE. OSBPL7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL7, correspond-

ing to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL7 BINDING SITE, designated SEQ ID:16404, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9047] Another function of GAM63 is therefore inhibition of Oxysterol binding protein-like 7 (OSBPL7, Accession NP_060201.3) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL7.

[9048] p100 (Accession NP_055205.1) is another GAM63 target gene, herein designated TARGET GENE. p100 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by p100, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of p100 BINDING SITE, designated SEQ ID:16615, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9049] Another function of GAM63 is therefore inhibition of p100 (Accession NP_055205.1), a gene which coactivates gene

expression regulated by the Epstein- Barr virus nuclear antigen 2 . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with p100.

[9050] The function of p100 has been established by previous studies. Epstein- Barr virus (EBV) nuclear antigen- 2 (EBNA2) activates transcription of specific genes and is essential for EBV- mediated B- lymphocyte transformation. Tong et al. (1995) showed that EBNA2 binds to the nuclear protein p100 and that p100 coactivates gene expression mediated by the EBNA2 acidic domain. Using affinity cloning, Tong et al. (1995) cloned the human p100 gene and showed that it encodes an 885- amino acid polypeptide that contains 2 potential nuclear localization signals. By Northern blotting, p100 appeared to be ubiquitously expressed. The p100 protein also binds both the p56 and p34 subunits of transcription factor IIE (OMIM Ref. No. 189962). Callebaut and Mornon (1997) identified a novel domain within the p100 sequence that they named the 'tudor domain' because it is present in multiple copies in the Drosophila 'tudor' protein. By somatic cell hybrid analysis and FISH, Lienard et al. (2000) mapped the SND1 gene to human chromosome 7q31.3 and rat chromosome

4q23.

[9051]

[9052] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9053] Tong, X.; Drapkin, R.; Yalamanchili, R.; Mosialos, G.; Kieff, E. : The Epstein- Barr virus nuclear protein 2 acidic domain forms a complex with a novel cellular coactivator that can interact with TFIIE. Molec. Cell. Biol. 15: 4735-4744, 1995. ; and

[9054] Callebaut, I.; Mornon, J. P. : The human EBNA- 2 coactivator p100: multidomain organization and relationship to the staphylococcal nuclease fold and to the tudor protein involved in Dros.

[9055] Further studies establishing the function and utilities of p100 are found in John Hopkins OMIM database record ID 602181, and in cited publications listed in Table 5, which are hereby incorporated by reference.P114-RHO-GEF (Accession NP_056133.1) is another GAM63 target gene, herein designated TARGET GENE. P114-RHO-GEF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by P114-RHO-GEF, corresponding to a target binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P114-RHO-GEF BINDING SITE, designated SEQ ID:14048, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9056] Another function of GAM63 is therefore inhibition of P114-RHO-GEF (Accession NP_056133.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P114-RHO-GEF.

[9057] P5-1 (Accession NP_006665.1) is another GAM63 target gene, herein designated TARGET GENE. P5-1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by P5-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P5-1 BINDING SITE, designated SEQ ID:14464, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9058] Another function of GAM63 is therefore inhibition of P5-1 (Accession NP_006665.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with P5-1.

[9059] Paired basic amino acid cleaving system 4 (PACE4, Accession NP_612192.1) is another GAM63 target gene, herein designated TARGET GENE. PACE4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PACE4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PACE4 BINDING SITE, designated SEQ ID:10623, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9060] Another function of GAM63 is therefore inhibition of Paired basic amino acid cleaving system 4 (PACE4, Accession NP_612192.1), a gene which processes hormone precursors by cleaving paired basic amino acids. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE4.

[9061] The function of PACE4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.1.Paired basic amino acid cleaving system 4

(PACE4, Accession NP_002561.1) is another GAM63 target gene, herein designated TARGET GENE. PACE4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PACE4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PACE4 BINDING SITE, designated SEQ ID:10623, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9062] Another function of GAM63 is therefore inhibition of Paired basic amino acid cleaving system 4 (PACE4, Accession NP_002561.1), a gene which processes hormone precursors by cleaving paired basic amino acids. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE4.

[9063] The function of PACE4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.1.PAGE-5 (Accession NP_569734.2) is another GAM63 target gene, herein designated TARGET GENE. PAGE-5 BINDING SITE is a target binding site found in the

5` untranslated region of mRNA encoded by PAGE-5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAGE-5 BINDING SITE, designated SEQ ID:8319, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9064] Another function of GAM63 is therefore inhibition of PAGE-5 (Accession NP_569734.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAGE-5.

[9065] Paralemmin (PALM, Accession NP_002570.1) is another GAM63 target gene, herein designated TARGET GENE. PALM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PALM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PALM BINDING SITE, designated SEQ ID:5652, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9066] Another function of GAM63 is therefore inhibition of Paralemmin (PALM, Accession NP_002570.1) . Accordingly,

utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PALM.

[9067] Poly(a) polymerase beta (testis specific) (PAPOLB, Accession NP_064529.2) is another GAM63 target gene, herein designated TARGET GENE. PAPOLB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PAPOLB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PAPOLB BINDING SITE, designated SEQ ID:5455, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9068] Another function of GAM63 is therefore inhibition of Poly(a) polymerase beta (testis specific) (PAPOLB, Accession NP_064529.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAPOLB.

[9069] Poly(rc) binding protein 3 (PCBP3, Accession NP_065389.1) is another GAM63 target gene, herein designated TARGET GENE. PCBP3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA

encoded by PCBP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCBP3 BINDING SITE, designated SEQ ID:4999, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9070] Another function of GAM63 is therefore inhibition of Poly(rc) binding protein 3 (PCBP3, Accession NP_065389.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP3.

[9071] Poly(rc) binding protein 4 (PCBP4, Accession NP_127501.1) is another GAM63 target gene, herein designated TARGET GENE. PCBP4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCBP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCBP4 BINDING SITE, designated SEQ ID:13884, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9072] Another function of GAM63 is therefore inhibition of

Poly(rc) binding protein 4 (PCBP4, Accession NP_127501.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP4.

[9073] Poly(rc) binding protein 4 (PCBP4, Accession NP_127503.1) is another GAM63 target gene, herein designated TARGET GENE. PCBP4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCBP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCBP4 BINDING SITE, designated SEQ ID:13884, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9074] Another function of GAM63 is therefore inhibition of Poly(rc) binding protein 4 (PCBP4, Accession NP_127503.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP4.

[9075] Poly(rc) binding protein 4 (PCBP4, Accession NP_065151.1) is another GAM63 target gene, herein designated TARGET GENE. PCBP4 BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCBP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCBP4 BINDING SITE, designated SEQ ID:13884, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9076] Another function of GAM63 is therefore inhibition of Poly(rc) binding protein 4 (PCBP4, Accession NP_065151.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP4.

[9077] Poly(rc) binding protein 4 (PCBP4, Accession NP_127502.1) is another GAM63 target gene, herein designated TARGET GENE. PCBP4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCBP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCBP4 BINDING SITE, designated SEQ ID:13884, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA,

also designated SEQ ID:348.

[9078] Another function of GAM63 is therefore inhibition of Poly(rc) binding protein 4 (PCBP4, Accession NP_127502.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP4.

[9079] Protocadherin 1 (cadherin-like 1) (PCDH1, Accession NP_115796.2) is another GAM63 target gene, herein designated TARGET GENE. PCDH1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCDH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDH1 BINDING SITE, designated SEQ ID:8176, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9080] Another function of GAM63 is therefore inhibition of Protocadherin 1 (cadherin-like 1) (PCDH1, Accession NP_115796.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH1.

[9081] Protocadherin 12 (PCDH12, Accession NP_057664.1) is

another GAM63 target gene, herein designated TARGET GENE. PCDH12 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PCDH12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDH12 BINDING SITE, designated SEQ ID:5173, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9082] Another function of GAM63 is therefore inhibition of Protocadherin 12 (PCDH12, Accession NP_057664.1), a gene which is a member of a family of nonclassical cadherins. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH12.

[9083] The function of PCDH12 has been established by previous studies. Murine vascular endothelial cadherin- 2 is a cellular adhesion molecule that is distinct from vascular endothelial cadherin- 1 (CDH5; 601120) in that it does not interact with catenins and does not appear to affect cell migration or growth (Telo et al., 1998). By sequence database searching, Wu and Maniatis (2000) identified a human VE- cadherin- 2 homolog, which they called pro-

tocadherin- 12 (OMIM Ref. No. PCDH12), encoding a deduced 1,184- amino acid protein that shares 81% sequence identity with the mouse protein. PCDH12 contains 4 exons; a single large exon encodes the extracellular and transmembrane domains, and 3 small exons encode the cytoplasmic domain. Wu and Maniatis (2000) concluded that the presence of unusually large exons is a characteristic feature of protocadherin. Using the mouse Pcdh12 cDNA sequence and RACE- PCR reactions, Ludwig et al. (2000) cloned a full- length PCDH12 cDNA from a human fetal kidney cDNA library. Northern blot analysis detected expression of a 5- kb PCHD12 transcript chiefly in highly vascularized tissues including the heart and placenta, but most tissues contained a low level of expression. Prominent expression was also detected in the spleen. Some tissues, including skeletal muscle and peripheral blood leukocytes, possessed transcripts of a larger size.

[9084]

[9085] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9086] Wu, Q.; Maniatis, T. : Large exons encoding multiple ectodomains are a characteristic feature of protocadherin

genes. Proc. Nat. Acad. Sci. 97: 3124- 3129, 2000. ; and

[9087] Ludwig, D.; Lorenz, J.; Dejana, E.; Bohlen, P.; Hicklin, D. J.; Witte, L.; Pytowski, B. : cDNA cloning, chromosomal mapping, and expression analysis of human VE- cadherin- 2. Mammalian Ge.

[9088] Further studies establishing the function and utilities of PCDH12 are found in John Hopkins OMIM database record ID 605622, and in cited publications listed in Table 5, which are hereby incorporated by reference.PDIP38 (Accession NP_056399.1) is another GAM63 target gene, herein designated TARGET GENE. PDIP38 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDIP38, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDIP38 BINDING SITE, designated SEQ ID:19488, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9089] Another function of GAM63 is therefore inhibition of PDIP38 (Accession NP_056399.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDIP38.

[9090] PDIP46 (Accession NP_835237.1) is another GAM63 target gene, herein designated TARGET GENE. PDIP46 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PDIP46, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDIP46 BINDING SITE, designated SEQ ID:2149, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9091] Another function of GAM63 is therefore inhibition of PDIP46 (Accession NP_835237.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDIP46.

[9092] PDIP46 (Accession NP_115687.2) is another GAM63 target gene, herein designated TARGET GENE. PDIP46 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PDIP46, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDIP46 BINDING SITE, designated SEQ ID:2149, to the nucleotide sequence of GAM63 RNA,

herein designated GAM RNA, also designated SEQ ID:348.

[9093] Another function of GAM63 is therefore inhibition of PDIP46 (Accession NP_115687.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDIP46.

[9094] PDZGEF1 (Accession NP_055062.1) is another GAM63 target gene, herein designated TARGET GENE. PDZGEF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDZGEF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDZGEF1 BINDING SITE, designated SEQ ID:2782, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9095] Another function of GAM63 is therefore inhibition of PDZGEF1 (Accession NP_055062.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZGEF1.

[9096] Period homolog 1 (drosophila) (PER1, Accession NP_002607.1) is another GAM63 target gene, herein designated TARGET GENE. PER1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by PER1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PER1 BINDING SITE, designated SEQ ID:10857, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9097] Another function of GAM63 is therefore inhibition of Period homolog 1 (drosophila) (PER1, Accession NP_002607.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER1.

[9098] Phosphoribosylformylglycinamidine synthase (fgar amidotransferase) (PFAS, Accession NP_036525.1) is another GAM63 target gene, herein designated TARGET GENE. PFAS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PFAS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PFAS BINDING SITE, designated SEQ ID:9390, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9099] Another function of GAM63 is therefore inhibition of

Phosphoribosylformylglycinamidine synthase (fgar amidotransferase) (PFAS, Accession NP_036525.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFAS.

[9100] Phosphofructokinase, liver (PFKL, Accession NP_002617.2) is another GAM63 target gene, herein designated TARGET GENE. PFKL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PFKL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PFKL BINDING SITE, designated SEQ ID:975, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9101] Another function of GAM63 is therefore inhibition of Phosphofructokinase, liver (PFKL, Accession NP_002617.2), a gene which functions in glycolysis, phosphorylates fructose- 6- phosphate to fructose- 1,6- bisphosphate. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFKL.

[9102] The function of PFKL has been established by previous

studies. Phosphofructokinase (PFK; ATP:D- fructose- 6- phosphate- 1- phosphotransferase, EC 2.7.1.11) is a tetramer formed by the random association of the products of two separate gene loci to form the five possible tetramers. PFKs of muscle and liver are homotetramers of the M and L subunits, respectively. Red cells have all five isozymes: M4, M3L, M2L2, ML3, and L4 (Vora et al., 1980). The M locus is mutant in glycogen storage disease VII (OMIM Ref. No. 232800). Vora et al. (1980) speculated that the heterogeneous group of hemolytic syndromes associated with partial red cell PFK deficiency without myopathy (Boulard et al., 1974; Kahn et al., 1975) may represent total absence of L subunits or qualitative defects of M or L subunits. Vora and Francke (1981) stated that there are three structural loci controlling PFK: M (OMIM Ref. No. muscle), L (liver), and P (platelet) type subunits. Fibroblasts express all three genes. By somatic cell hybridization, the authors found that the liver type is determined by a gene on chromosome 21. The mean red cell PFK is elevated in persons with Down syndrome. Vora et al. (1983) described a completely asymptomatic man who was apparently heterozygous for a mutant unstable L subunit, which was found also in his asymptomatic son. Ery-

throcyte metabolism was normal and there was no evidence of hemolysis. Some 20 unrelated families with PFK deficiency had been previously reported. Vora et al. (1983) suggested that these can be divided into 5 major groups: I- - the classic syndrome of simultaneous myopathy and hemolysis (see OMIM Ref. No. 232800); II- - isolated myopathy; III- - hemolysis only; IV- - asymptomatic partial deficiency of red cell PFK (e.g., Boulard et al., 1974); and V- - progressive, fatal myopathy with other atypical features. Group II is of doubtful validity; it probably represents cases in which red cells were inadequately studied. Although some Group III cases have been found to belong in Group I, others (e.g., Etiemble et al., 1976; Miwa et al., 1972) may be genuine. An asymptomatic kindred of Etiemble et al. (1980) had an unstable M subunit. The nature of Group V is unclear. Several of the PFK cases have been of Russian- Jewish extraction, suggesting to Vora et al. (1983) an unusually high frequency. By study of dosage effects in cases of partial monosomy or partial trisomy of chromosome 21, Chadefaux et al. (1984) concluded that the liver- type PFK is located at 21q21- qter. This is consistent with the regional assignment to 21q22 by Cox et al. (1984). Using a human- specific monoclonal antibody

for PFKL in the study of hamster- human hybrids, Van Keuren et al. (1986) located the gene on band 21q22.3. Levanon et al. (1986) confirmed the assignment of PFKL to chromosome 21 by demonstrating hybridization of genomic clones to the DNA from mouse- human hybrid cells containing chromosome 21 as the only human chromosome. By linkage studies with RFLPs, Petersen et al. (1991) confirmed the location of the gene in band 21q22.3 and determined its location relative to 15 other genes and DNA markers. Gehnrich et al. (1988) described the isolation and nucleotide sequencing of liver PFK cDNA and presented evidence of hormonal and nutritional regulation of PFKL mRNA. Elson et al. (1990) concluded that the PFKL gene is at least 28 kb long and is divided into 22 exons.

[9103]

[9104] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9105] Petersen, M. B.; Slaugenhaupt, S. A.; Lewis, J. G.; Warren, A. C.; Chakravarti, A.; Antonarakis, S. E. : A genetic linkage map of 27 markers on human chromosome 21. Genomics 9: 407- 419, 1991. ; and

phosphofructokinase mRNA: cloning, structure, and expression. J. Biol. Chem. 263: 11755- 11759, 1988.

[9107] Further studies establishing the function and utilities of PFKL are found in John Hopkins OMIM database record ID 171860, and in cited publications listed in Table 5, which are hereby incorporated by reference.Profilin 2 (PFN2, Accession NP_002619.1) is another GAM63 target gene, herein designated TARGET GENE. PFN2 BINDING SITE1 and PFN2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by PFN2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PFN2 BINDING SITE1 and PFN2 BINDING SITE2, designated SEQ ID:1957 and SEQ ID:15687 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9108] Another function of GAM63 is therefore inhibition of Profilin 2 (PFN2, Accession NP_002619.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFN2.

[9109] Phosphorylase kinase, gamma 2 (testis) (PHKG2, Acces-

sion NP_000285.1) is another GAM63 target gene, herein designated TARGET GENE. PHKG2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PHKG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PHKG2 BINDING SITE, designated SEQ ID:7564, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9110] Another function of GAM63 is therefore inhibition of Phosphorylase kinase, gamma 2 (testis) (PHKG2, Accession NP_000285.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHKG2.

[9111] Phosphatidylinositol-4-phosphate 5-kinase, type ii, beta (PIP5K2B, Accession NP_003550.1) is another GAM63 target gene, herein designated TARGET GENE. PIP5K2B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PIP5K2B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIP5K2B BINDING SITE, designated

SEQ ID:16136, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9112] Another function of GAM63 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, type ii, beta (PIP5K2B, Accession NP_003550.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K2B.

[9113] Pleckstrin (PLEK, Accession NP_002655.1) is another GAM63 target gene, herein designated TARGET GENE. PLEK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLEK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLEK BINDING SITE, designated SEQ ID:11928, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9114] Another function of GAM63 is therefore inhibition of Pleckstrin (PLEK, Accession NP_002655.1), a gene which is the major protein kinase c substrate of platelets. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLEK.

[9115] The function of PLEK has been established by previous studies. In platelets, agonists that stimulate phosphoinositide turnover cause the rapid phosphorylation of a protein of apparent relative molecular mass 40,000-47,000, called P47, by protein kinase C. Tyers et al. (1988) isolated human P47 clones by immunologic screening of a lambda- gt11 cDNA library from a promyelocytic leukemia cell line. A 1,050 basepair open reading frame that could encode the protein in question was confirmed by comparison with peptide sequences from platelet P47 and by expression of the putative P47 in E. coli and in vitro. The P47 sequence appeared to have been conserved throughout vertebrate evolution and was not similar to any other known sequence, including lipocortin (OMIM Ref. No. 151690). Based on its specific expression in platelets and various differentiated white blood cells, Tyers et al. (1988) proposed the name pleckstrin for platelet and leukocyte C kinase substrate and for the KSTR string of amino acids in the sequence KFARKSTRRSIR, the probable phosphorylation site. Tyers et al. (1989) reported the pleckstrin sequence. They deduced a molecular weight of 40,087. By differential display comparison of murine epidermal promotion- sensitive and - resistant

cell lines after exposure to a tumor promoter, phorbol ester TPA, Cmarik et al. (2000) observed preferential expression in promotion- resistant cells of a cDNA encoding Plek. Northern blot analysis detected a 3.6- kb Plek transcript in mouse heart, lung, and spleen. Mouse Plek shares 91% amino acid identity with human PLEK. Using an interspecific backcross panel, Cmarik et al. (2000) mapped the mouse Plek gene to the proximal part of chromosome 11 in a region showing homology of synteny to human 2p, where they stated the PLEK gene has been mapped.

[9116]

[9117] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9118] Cmarik, J. L.; Hegamyer, G.; Gerrard, B.; Dean, M.; Colburn, N. H. : cDNA cloning and mapping of mouse pleckstrin (Plek), a gene upregulated in transformation- resistant cells. Genomics 66: 204- 212, 2000. ; and

[9119] Tyers, M.; Haslam, R. J.; Rachubinski, R. A.; Harley, C. B. : Molecular analysis of pleckstrin: the major protein kinase C substrate of platelets. J. Cell. Biochem. 40: 133- 145, 1989.

[9120] Further studies establishing the function and utilities of PLEK are found in John Hopkins OMIM database record ID 173570, and in cited publications listed in Table 5, which are hereby incorporated by reference.Proteolipid protein 1 (pelizaeus-merzbacher disease, spastic paraplegia 2, uncomplicated) (PLP1, Accession NP_000524.2) is another GAM63 target gene, herein designated TARGET GENE. PLP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLP1 BINDING SITE, designated SEQ ID:11746, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9121] Another function of GAM63 is therefore inhibition of Proteolipid protein 1 (pelizaeus-merzbacher disease, spastic paraplegia 2, uncomplicated) (PLP1, Accession NP_000524.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLP1.

[9122] Peanut-like 1 (drosophila) (PNUTL1, Accession NP_002679.2) is another GAM63 target gene, herein des-

ignated TARGET GENE. PNUTL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PNUTL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PNUTL1 BINDING SITE, designated SEQ ID:3567, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9123] Another function of GAM63 is therefore inhibition of Peanut-like 1 (drosophila) (PNUTL1, Accession NP_002679.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNUTL1.

[9124] POF1B (Accession NP_079197.2) is another GAM63 target gene, herein designated TARGET GENE. POF1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by POF1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POF1B BINDING SITE, designated SEQ ID:8710, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also

designated SEQ ID:348.

[9125] Another function of GAM63 is therefore inhibition of POF1B (Accession NP_079197.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POF1B.

[9126] Protein phosphatase 1b (formerly 2c), magnesium-dependent, beta isoform (PPM1B, Accession NP_002697.1) is another GAM63 target gene, herein designated TARGET GENE. PPM1B BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PPM1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPM1B BINDING SITE, designated SEQ ID:1077, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9127] Another function of GAM63 is therefore inhibition of Protein phosphatase 1b (formerly 2c), magnesium-dependent, beta isoform (PPM1B, Accession NP_002697.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPM1B.

[9128] Protein phosphatase 1b (formerly 2c), magnesium-dependent, beta isoform (PPM1B, Accession NP_808907.1) is another GAM63 target gene, herein designated TARGET GENE. PPM1B BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PPM1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPM1B BINDING SITE, designated SEQ ID:1077, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9129] Another function of GAM63 is therefore inhibition of Protein phosphatase 1b (formerly 2c), magnesium-dependent, beta isoform (PPM1B, Accession NP_808907.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPM1B.

[9130] Palmitoyl-protein thioesterase 2 (PPT2, Accession NP_620312.1) is another GAM63 target gene, herein designated TARGET GENE. PPT2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PPT2, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPT2 BINDING SITE, designated SEQ ID:3705, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9131] Another function of GAM63 is therefore inhibition of Palmitoyl-protein thioesterase 2 (PPT2, Accession NP_620312.1), a gene which is a palmitoyl- protein thioesterase 2 which possesses a different substrate specificity than PPT1. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPT2.

[9132] The function of PPT2 has been established by previous studies. Palmitoyl- protein thioesterase- 1 (PPT1; 600722) is a lysosomal hydrolase that removes long- chain fatty acyl groups from modified cysteine residues in proteins. Mutations in PPT1 have been found to cause the infantile form of neuronal ceroid lipofuscinosis (INCL; 256730). By searching sequence databases for homologs of PPT1, Soyombo and Hofmann (1997) identified cDNAs encoding PPT2. The deduced PPT2 protein contains 302 amino acids, including a 27- amino acid leader peptide, a se-

quence motif characteristic of many thioesterases and lipases, and 5 potential N- linked glycosylation sites. PPT2 shares 18% amino acid identity with PPT1. Northern blot analysis detected a predominant 2.0- kb PPT2 transcript in the human tissues examined, with the highest expression in skeletal muscle; variable amounts of 2.8- and 7.0-kb transcripts were also observed. Immunoblot analysis of recombinant PPT2 expressed in mammalian cells showed 6 PPT2 proteins ranging in size from 31 to 42 kD. Treatment that removes asparagine- linked oligosaccharides resulted in a single major protein of 31 kD and a minor protein of 33 kD. The authors demonstrated that recombinant PPT2, like PPT1, possesses thioesterase activity and localizes to the lysosome. Since PPT2 could not substitute for PPT1 in correcting the metabolic defect in INCL cells and was unable to remove palmitate groups from palmitoylated proteins that are routinely used as substrates for PPT1, Soyombo and Hofmann (1997) suggested that PPT2 possesses a different substrate specificity than PPT1.

[9133] Animal model experiments lend further support to the function of PPT2. Gupta et al. (2001) engineered disruptions in the Ppt1 and Ppt2 genes to create knockout mice that were deficient in either enzyme. Both lines of mice

were viable and fertile; however, both lines developed spasticity (a 'clasping' phenotype) at a median age of 21 weeks and 29 weeks, respectively. Motor abnormalities progressed in the Ppt1 knockout mice, leading to death by 10 months of age. In contrast, most Ppt2 mice were alive at 12 months. Myoclonic jerking and seizures were prominent in the Ppt1 mice. Autofluorescent storage material was striking throughout the brains of both strains of mice. Neuronal loss and apoptosis were particularly prominent in Ppt1- deficient brains. These studies provided a mouse model for infantile neuronal ceroid lipofuscinosis and further suggested that PPT2 serves a role in the brain that is not carried out by PPT1.

[9134] It is appreciated that the abovementioned animal model for PPT2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[9135] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9136] Gupta, P.; Soyombo, A. A.; Atashband, A.; Wisniewski, K. E.; Shelton, J. M.; Richardson, J. A.; Hammer, R. E.; Hofmann, S. L. : Disruption of PPT1 or PPT2 causes neuronal

ceroid lipofuscinosis in knockout mice. Proc. Nat. Acad. Sci. 98: 13566- 13571, 2001. ; and

[9138] Further studies establishing the function and utilities of PPT2 are found in John Hopkins OMIM database record ID 603298, and in cited publications listed in Table 5, which are hereby incorporated by reference.Palmitoyl-protein thioesterase 2 (PPT2, Accession NP_005146.3) is another GAM63 target gene, herein designated TARGET GENE. PPT2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PPT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPT2 BINDING SITE, designated SEQ ID:3705, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9139] Another function of GAM63 is therefore inhibition of Palmitoyl-protein thioesterase 2 (PPT2, Accession NP_005146.3), a gene which is a palmitoyl- protein

thioesterase 2 which possesses a different substrate specificity than PPT1. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPT2.

[9140] The function of PPT2 has been established by previous studies. Palmitoyl- protein thioesterase- 1 (PPT1; 600722) is a lysosomal hydrolase that removes long- chain fatty acyl groups from modified cysteine residues in proteins. Mutations in PPT1 have been found to cause the infantile form of neuronal ceroid lipofuscinosis (INCL; 256730). By searching sequence databases for homologs of PPT1, Soyombo and Hofmann (1997) identified cDNAs encoding PPT2. The deduced PPT2 protein contains 302 amino acids, including a 27- amino acid leader peptide, a sequence motif characteristic of many thioesterases and lipases, and 5 potential N- linked glycosylation sites. PPT2 shares 18% amino acid identity with PPT1. Northern blot analysis detected a predominant 2.0- kb PPT2 transcript in the human tissues examined, with the highest expression in skeletal muscle; variable amounts of 2.8- and 7.0- kb transcripts were also observed. Immunoblot analysis of recombinant PPT2 expressed in mammalian cells showed 6 PPT2 proteins ranging in size from 31 to 42 kD. Treat-

ment that removes asparagine- linked oligosaccharides resulted in a single major protein of 31 kD and a minor protein of 33 kD. The authors demonstrated that recombinant PPT2, like PPT1, possesses thioesterase activity and localizes to the lysosome. Since PPT2 could not substitute for PPT1 in correcting the metabolic defect in INCL cells and was unable to remove palmitate groups from palmitoylated proteins that are routinely used as substrates for PPT1, Soyombo and Hofmann (1997) suggested that PPT2 possesses a different substrate specificity than PPT1.

[9141] Animal model experiments lend further support to the function of PPT2. Gupta et al. (2001) engineered disruptions in the Ppt1 and Ppt2 genes to create knockout mice that were deficient in either enzyme. Both lines of mice were viable and fertile; however, both lines developed spasticity (a 'clasping' phenotype) at a median age of 21 weeks and 29 weeks, respectively. Motor abnormalities progressed in the Ppt1 knockout mice, leading to death by 10 months of age. In contrast, most Ppt2 mice were alive at 12 months. Myoclonic jerking and seizures were prominent in the Ppt1 mice. Autofluorescent storage material was striking throughout the brains of both strains of mice. Neuronal loss and apoptosis were particularly prominent

in Ppt1- deficient brains. These studies provided a mouse model for infantile neuronal ceroid lipofuscinosis and further suggested that PPT2 serves a role in the brain that is not carried out by PPT1.

[9142] It is appreciated that the abovementioned animal model for PPT2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[9143] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9144] Gupta, P.; Soyombo, A. A.; Atashband, A.; Wisniewski, K. E.; Shelton, J. M.; Richardson, J. A.; Hammer, R. E.; Hofmann, S. L. : Disruption of PPT1 or PPT2 causes neuronal ceroid lipofuscinosis in knockout mice. Proc. Nat. Acad. Sci. 98: 13566- 13571, 2001. ; and

[9145] Soyombo, A. A.; Hofmann, S. L. : Molecular cloning and expression of palmitoyl- protein thioesterase 2 (PPT2), a homolog of lysosomal palmitoyl- protein thioesterase with a distinct subs.

[9146] Further studies establishing the function and utilities of PPT2 are found in John Hopkins OMIM database record ID 603298, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Prolactin receptor (PRLR, Accession NP_000940.1) is another GAM63 target gene, herein designated TARGET GENE. PRLR BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRLR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRLR BINDING SITE, designated SEQ ID:2391, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9147] Another function of GAM63 is therefore inhibition of Prolactin receptor (PRLR, Accession NP_000940.1), a gene which is a receptor for the anterior pituitary hormone prolactin. and therefore may be associated with Tumors. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Tumors, and of other diseases and clinical conditions associated with PRLR.

[9148] The function of PRLR has been established by previous studies. Owerbach et al. (1981) did Southern blot analyses of DNA from human- mouse cell hybrids to show that the prolactin gene is located on chromosome 6 (Owerbach et al., 1981). It bears homology to the genes for growth hor-

mone (OMIM Ref. No. 139250) and chorionic somatomammotropin (OMIM Ref. No. 150200), which are on chromosome 17, but not as close homology as these two bear to each other (Cooke et al., 1981). Only 16% sequence homology of the growth hormone and prolactin gene has been found (Shome and Parlow, 1977). The regional assignment of prolactin is of interest because of possible association between prolactin- secreting adenomas and specific HLA alleles (Farid et al., 1980). Larrea et al. (1987) presented the results of family studies suggesting that there is a familial factor determining the occurrence of the 'big- big' form as the predominant immunoreactive PRL species in blood. By somatic cell hybridization, Taggart et al. (1987) narrowed the assignment of the PRL gene to 6pter- p21.1. Evans et al. (1988, 1989) mapped the prolactin gene in a series of overlapping deletions of chromosome 6 produced by gamma- irradiation of a human lymphoblastoid cell line followed by selection for HLA antigen- loss mutants As pointed out by DiMattia (1998), the PRL gene possesses alternative tissue- specific promoters that are located 5,563 basepairs apart. The 5- prime promoter is specific for expression of prolactin in the decidualized human endometrium and in

lymphoblastoid cells such as the human cell line IM- 9- P3; the downstream promoter is specific for expression in the pituitary lactotrope and is under the control of the POU- homeodomain transcription factor PIT1 (OMIM Ref. No. 173110). Transcriptional control of the nonpituitary start site is linked to the differentiation of the endometrial stromal cell into the decidual cell during the secretory phase of the ovulatory cycle (DiMattia et al., 1990, Gellersen et al., 1994). By deletion analysis of the human PRL promoter in endometrial stromal cells decidualized in vitro, Watanabe et al. (2001) demonstrated a 536- bp enhancer located between nucleotides - 2040 and - 1505 in the 5- prime- flanking region. DNase I footprint analysis of decidualized endometrial stromal cells revealed 3 protected regions, FP1- FP3. Transfection of overlapping 100- bp fragments of the 536- bp enhancer indicated that FP1 and FP3 each conferred enhancer activity. Gel shift assays indicated that both FP1 and FP3 bind AP1 (OMIM Ref. No. 165160), and that JUND (OMIM Ref. No. 165162) and FOSL2 (OMIM Ref. No. 601575) are components of the AP1 complex in decidual fibroblasts. Mutation of the AP1 binding site in either FP1 or FP3 decreased enhancer activity by approximately 50%, while mutation of

both sites almost completely abolished activity

[9149]

[9150] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9151] Watanabe, K.; Kessler, C. A.; Bachurski, C. J.; Kanda, Y.; Richardson, B. D.; Stanek, J.; Handwerger, S.; Brar, A. K. : Identification of a decidua- specific enhancer on the human prolactin gene with two critical activator protein 1 (AP- 1) binding sites. Molec. Endocr. 15: 638- 653, 2001. ; and

[9152] DiMattia, G. E.; Gellersen, B.; Duckworth, M. L.; Friesen, H. G. : Human prolactin gene expression: the use of an alternative noncoding exon in decidua and the IM- 9- P3 lymphoblast cell.

[9153] Further studies establishing the function and utilities of PRLR are found in John Hopkins OMIM database record ID 176761, and in cited publications listed in Table 5, which are hereby incorporated by reference.PRO0159 (Accession NP_054837.1) is another GAM63 target gene, herein designated TARGET GENE. PRO0159 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRO0159, corresponding to a target binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0159 BINDING SITE, designated SEQ ID:17869, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9154] Another function of GAM63 is therefore inhibition of PRO0159 (Accession NP_054837.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0159.

[9155] PRO0456 (Accession NP_054846.1) is another GAM63 target gene, herein designated TARGET GENE. PRO0456 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRO0456, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0456 BINDING SITE, designated SEQ ID:7771, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9156] Another function of GAM63 is therefore inhibition of PRO0456 (Accession NP_054846.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PRO0456.

[9157] Protein c receptor, endothelial (epcr) (PROCR, Accession NP_006395.1) is another GAM63 target gene, herein designated TARGET GENE. PROCR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PROCR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PROCR BINDING SITE, designated SEQ ID:20145, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9158] Another function of GAM63 is therefore inhibition of Protein c receptor, endothelial (epcr) (PROCR, Accession NP_006395.1), a gene which binds protein C in a calcium-dependent manner. and therefore may be associated with Venous thromboembolism and myocardial infarction. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Venous thromboembolism and myocardial infarction, and of other diseases and clinical conditions associated with PROCR.

[9159] The function of PROCR has been established by previous studies. Protein C (OMIM Ref. No. 176860), a vitamin K-dependent serine protease zymogen, plays a major role in

blood coagulation and may also prevent the lethal effects of gram- negative sepsis. Deficiency of protein C leads to life- threatening thrombophilia. Protein C is activated when thrombin (F2; 176930), the terminal enzyme of the coagulation system, binds to an endothelial cell surface protein, thrombomodulin (THBD; 188040). Using immunohistochemical analysis, Ye et al. (1999) demonstrated that EPCR is expressed strongly in the endothelial cells of arteries and veins in heart and lung, less intensely in capillaries in the lung and skin, and not at all in the endothelium of small vessels of the liver and kidney. Immunoblot analysis showed that EPCR is expressed as a 49- kD protein that is reduced to the predicted 25 kD by deglycosylation. Antibodies to EPCR could inhibit binding of protein C and APC to cultured endothelial cells and inhibited the activation of protein C. Simmonds and Lane (1999) pointed out that THBD is uniformly expressed on endothelial cells, significantly reducing its effective concentration on large vessels, whereas EPCR, with its high affinity for protein C, is preferentially expressed on large vessels. Riewald et al. (2002) demonstrated that activated protein C (OMIM Ref. No. 176860) uses the endothelial cell protein C receptor (EPCR) as a coreceptor for cleavage

of protease- activated receptor 1 (PAR1; 187930) on endothelial cells. Gene profiling demonstrated that PAR1 signaling could account for all activated protein C- induced protective genes, including the immunomodulatory monocyte chemoattractant protein- 1 (MCP1; 158105), which was selectively induced by activation of PAR1, but not PAR2 (OMIM Ref. No. 600933). Thus, Riewald et al. (2002) concluded that the prototypical thrombin receptor is the target for EPCR- dependent APC signaling, suggesting a role for this receptor cascade in protection from sepsis.

[9160]

[9161] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9162] Riewald, M.; Petrovan, R. J.; Donner, A.; Mueller, B. M.; Ruf, W. : Activation of endothelial cell protease activated receptor 1 by the protein C pathway. Science 296: 1880-1882, 2002. ; and

[9163] Simmonds, R. E.; Lane, D. A. : Structural and functional implications of the intron/exon organization of the human endothelial cell protein C/activated protein C receptor (EPCR) gene: c.

[9164] Further studies establishing the function and utilities of PROCR are found in John Hopkins OMIM database record ID 600646, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pregnancy specific beta-1-glycoprotein 7 (PSG7, Accession NP_002774.1) is another GAM63 target gene, herein designated TARGET GENE. PSG7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PSG7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSG7 BINDING SITE, designated SEQ ID:14910, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9165] Another function of GAM63 is therefore inhibition of Pregnancy specific beta-1-glycoprotein 7 (PSG7, Accession NP_002774.1), a gene which function still unknown. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSG7.

[9166] The function of PSG7 has been established by previous studies. The human pregnancy- specific glycoproteins (PSGs) are a group of molecules that are mainly produced

by the placental syncytiotrophoblasts during pregnancy. PSGs comprise a subgroup of the carcinoembryonic antigen (CEA) family, which belongs to the immunoglobulin superfamily. See PSG3 (OMIM Ref. No. 176392) for additional information about PSGs. Teglund et al. (1994) found that the PSG7 gene contains 6 exons. Studies by several groups resulted in the mapping of the CEA gene family to 19q13.1- q13.2 (Thompson et al., 1990; Thompson et al., 1992; Tynan et al., 1992; Trask et al., 1993). The PSG subgroup is located telomeric of the CEA subgroup, and together they span approximately 1.1 to 1.2 Mb (Brandriff et al., 1992; Tynan et al., 1992). Using a high- resolution restriction fragment fingerprinting technique, Olsen et al. (1994) assembled 256 cosmids spanning the PSG region on 19q13.2 into a single 700- kb contig. FISH to sperm pronuclei and cosmid walking experiments indicated that this PSG contig is telomeric of CGM8 at the telomeric end of the CEA subgroup gene cluster. Detailed restriction mapping and hybridization with gene- specific probes indicated that the order of the 11 PSG genes in the contig is cen- - PSG3- - PSG8 (OMIM Ref. No. 176397)- - PSG12 (PSG10; 176399)- - PSG1 (OMIM Ref. No. 176390)- - PSG6 (OMIM Ref. No. 176395)- - PSG7- - PSG13 (PSG11;

176401)- - PSG2 (OMIM Ref. No. 176391)- - PSG5 (OMIM Ref. No. 176394)- - PSG4 (OMIM Ref. No. 176393)- - PSG11 (PSG9; 176398)- - tel. The PSG genes are tandemly oriented in a 5- prime to 3- prime direction from telomere to centromere. The CEA subgroup gene CGM11 is located at the telomeric end of the PSG gene cluster, and 6 genes belonging to a third CEA family subgroup, namely CGM13 through CGM18 (later OMIM Ref. No. 109770), are interspersed among the PSG genes. Nomenclature: Beauchemin et al. (1999) provided a revised nomenclature for the CEA gene family. Based on this nomenclature, the CEA family is composed of the PSG subfamily, the CEACAM subfamily (see OMIM Ref. No. 109770), and the CEACAM pseudogene (CEACAMP) subfamily (see OMIM Ref. No. 109770). PSG11, PSG12, and PSG13 were renamed PSG9, PSG10, and PSG11, respectively.

[9167]

[9168] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9169] Beauchemin, N.; Draber, P.; Dveksler, G.; Gold, P.; Gray-Owen, S.; Grunert, F.; Hammarstrom, S.; Holmes, K. V.; Karlsson, A.; Kuroki, M.; Lin, S.- H.; Lucka, L.; and 13 oth-

ers : Redefined nomenclature for members of the carcinoembryonic antigen family. Exp. Cell Res. 252: 243-249, 1999. ; and

[9170] Brandriff, B. F.; Gordon, L. A.; Tynan, K. T.; Olsen, A. S.; Mohrenweiser, H. W.; Fertitta, A.; Carrano, A. V.; Trask, B. J. : Order and genomic distances among members of the carcinoem.

[9171] Further studies establishing the function and utilities of PSG7 are found in John Hopkins OMIM database record ID 176396, and in cited publications listed in Table 5, which are hereby incorporated by reference.Proteasome (prosome, macropain) 26s subunit, atpase, 3 (PSMC3, Accession NP_002795.2) is another GAM63 target gene, herein designated TARGET GENE. PSMC3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PSMC3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSMC3 BINDING SITE, designated SEQ ID:16328, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9172] Another function of GAM63 is therefore inhibition of Pro-

teasome (prosome, macropain) 26s subunit, atpase, 3 (PSMC3, Accession NP_002795.2), a gene which is the ATPase subunit of the 26S proteasome (prosome macropain). Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMC3.

[9173] The function of PSMC3 has been established by previous studies. The human immunodeficiency virus- 1 (HIV- 1) protein Tat is a potent activator of virus gene expression and replication. Nelbock et al. (1990) used biotinylated Tat as a probe to screen a lambda- gt11 fusion protein library, thereby cloning a cDNA encoding a protein that interacts with Tat. Expression of this protein, designated Tat- binding protein- 1, was observed in a variety of cell lines, with expression being highest in human cells. TBP1 was localized predominantly in the nucleus, which is consistent with the nuclear localization of Tat. In cotransfection experiments, expression of TBP1 was able to suppress Tat- mediated transactivation specifically. Nelbock et al. (1990) recommended their strategy for direct identification and cloning of genes encoding proteins that associate with other proteins to modulate their activity in a positive or negative fashion. Ohana et al. (1993) sug-

gested that TBP1 is involved in Tat- mediated transcriptional activation. Ubiquitinated proteins are degraded by a 26S ATP- dependent protease. The protease is composed of a 20S catalytic proteasome and 2 PA700 regulatory modules (see OMIM Ref. No. PSMC1; 602706). DeMartino et al. (1996) identified a protein complex that enhances PA700 activation of the proteasome. They found that 2 proteins, p42 (PSMC6; 602708) and p50 (PSMC3), are components of both this complex and PA700. By protein sequence analysis, DeMartino et al. (1996) determined that p50 and TBP1 are identical.

[9174]

[9175] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Identification, purification, and characterization of a PA700- depen.

[9178] Further studies establishing the function and utilities of PSMC3 are found in John Hopkins OMIM database record ID 186852, and in cited publications listed in Table 5, which are hereby incorporated by reference.Phosphatidylserine synthase 1 (PTDSS1, Accession NP_055569.1) is another GAM63 target gene, herein designated TARGET GENE. PTDSS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTDSS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTDSS1 BINDING SITE, designated SEQ ID:12178, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9179] Another function of GAM63 is therefore inhibition of Phosphatidylserine synthase 1 (PTDSS1, Accession NP_055569.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTDSS1.

[9180] Phosphatase and tensin homolog (mutated in multiple ad-

vanced cancers 1) (PTEN, Accession NP_000305.1) is another GAM63 target gene, herein designated TARGET GENE. PTEN BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PTEN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTEN BINDING SITE, designated SEQ ID:6023, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9181] Another function of GAM63 is therefore inhibition of Phosphatase and tensin homolog (mutated in multiple advanced cancers 1) (PTEN, Accession NP_000305.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTEN.

[9182] Rab1b, member ras oncogene family (RAB1B, Accession NP_112243.1) is another GAM63 target gene, herein designated TARGET GENE. RAB1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of RAB1B BINDING SITE, designated SEQ ID:5292, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9183] Another function of GAM63 is therefore inhibition of Rab1b, member ras oncogene family (RAB1B, Accession NP_112243.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB1B.

[9184] Rab interacting factor (RABIF, Accession NP_002862.2) is another GAM63 target gene, herein designated TARGET GENE. RABIF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RABIF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RABIF BINDING SITE, designated SEQ ID:10935, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9185] Another function of GAM63 is therefore inhibition of Rab interacting factor (RABIF, Accession NP_002862.2), a gene which is involved in the regulation of intracellular vesicular transport. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with RABIF.

[9186] The function of RABIF has been established by previous studies. The Sec4/Rab- related small GTP- binding proteins are involved in the regulation of intracellular vesicular transport. Mss4 stimulates GTP- GDP exchange in Sec4 and Rab and binds to a subset of genetically related Rab proteins. Yu and Schreiber (1995) cloned a human MSS4 cDNA. The gene encodes a 123- amino acid polypeptide that requires zinc for stability. Muller- Pillasch et al. (1997) showed by Northern blot analysis that MSS4 is expressed as 3 differently sized mRNAs, probably due to alternative polyadenylation signals. The transcripts are present at barely detectable levels in healthy pancreas, but at much higher levels in pancreatic and other cancer tissues. Muller- Pillasch et al. (1997) used fluorescence in situ hybridization to map the MSS4 gene to human chromosome 1q32- q41.

[9187]

[9188] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9189] Muller- Pillasch, F.; Zimmerhackl, F.; Lacher, U.; Schultz, N.; Hameister, H.; Varga, G.; Friess, H.; Buchler, M.; Adler,

G.; Gress, T. M. : Cloning of novel transcripts of the human guanine- nucleotide- exchange factor Mss4: in situ chromosomal mapping and expression in pancreatic cancer. Genomics 46: 389- 396, 1997. ; and

[9190] Yu, H.; Schreiber, S. L. : Cloning, Zn(2+) binding, and structural characterization of the guanine nucleotide exchange factor human Mss4. Biochemistry 34: 9103- 9110, 1995.

[9191] Further studies establishing the function and utilities of RABIF are found in John Hopkins OMIM database record ID 603417, and in cited publications listed in Table 5, which are hereby incorporated by reference.Retinoic acid induced 14 (RAI14, Accession NP_056392.1) is another GAM63 target gene, herein designated TARGET GENE. RAI14 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAI14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAI14 BINDING SITE, designated SEQ ID:2934, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9192] Another function of GAM63 is therefore inhibition of Retinoic acid induced 14 (RAI14, Accession NP_056392.1), a gene which is required for protein transport from the er to the golgi complex. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI14.

[9193] The function of RAI14 has been established by previous studies. Nagase et al. (2000) isolated a cDNA encoding RAI14, which they called KIAA1334, from a size- fractionated fetal brain cDNA library. Kutty et al. (2001) characterized the RAI14 gene, which they called NORPEG, from human retinal pigment epithelial cells (ARPE- 19), in which its expression is induced by all- trans- retinoic acid. The predicted human and mouse proteins contain 980 and 979 amino acids, respectively, and share 84% sequence identity. Human RAI14 has a predicted molecular mass of 110 kD, a pI of 5.83, 6 potential N- glycosylation sites, several ankyrin repeats, and several coiled- coil helical domains. Northern blot analysis of human tissues detected expression of 2 transcripts of approximately 5 and 3 kb. Like the ARPE- 19 cells, placenta showed an intense signal at 5 kb and a weak signal at 3 kb; the reverse was observed in testis, with an intense signal at 3 kb and a

weak signal at 5 kb. RAI14 was also highly expressed in several human cancer cell lines. Expression studies showed that RAI14 localizes to the cytoplasm. Confocal microscopic analysis in ARPE- 19 cells showed threadlike projections in the cytoplasm reminiscent of the cytoskeleton. The expression of Rai14 was detected in mouse embryo at embryonic day 9.5 by in situ hybridization, and the expression appeared to be developmentally regulated. In adult mouse, the highest level of expression was detected in the seminiferous tubules of testis.

[9194]

[9195] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9198] Further studies establishing the function and utilities of RAI14 are found in John Hopkins OMIM database record ID 606586, and in cited publications listed in Table 5, which are hereby incorporated by reference.RDHL (Accession NP_005762.2) is another GAM63 target gene, herein designated TARGET GENE. RDHL BINDING SITE1 and RDHL BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by RDHL, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RDHL BINDING SITE1 and RDHL BINDING SITE2, designated SEQ ID:19957 and SEQ ID:5428 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9199] Another function of GAM63 is therefore inhibition of RDHL (Accession NP_005762.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDHL.

[9200] Regenerating islet-derived-like, pancreatic stone protein-like, pancreatic thread protein-like (rat) (REGL, Accession NP_006499.1) is another GAM63 target gene, herein designated TARGET GENE. REGL BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by REGL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of REGL BINDING SITE, designated SEQ ID:7886, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9201] Another function of GAM63 is therefore inhibition of Re-generating islet-derived-like, pancreatic stone protein-like, pancreatic thread protein-like (rat) (REGL, Accession NP_006499.1), a gene which is a member of REG family with unknown function. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REGL.

[9202] The function of REGL has been established by previous studies. The REG1A (OMIM Ref. No. 167770) and REG1B genes belong to the type I subclass of the REG family of genes, each of which encodes a 166- amino acid protein. Moriizumi et al. (1994) and Gharib et al. (1993) mapped the REG1A and REG1B genes to 2p12. Miyashita et al. (1995) demonstrated that 4 REG family genes are tandemly ordered in a 95- kb DNA region of 2p12. From analysis of YAC clones containing the 4 genes using 2-

color fluorescence in situ hybridization, they demonstrated the following order: 2cen- - PAP- - RS- - REG1A- - REG1B- - ptel. (RS, so designated for REG- related sequence, shows a high degree of homology to the REG1 genes but has an in- frame stop codon in the protein coding region.)

[9203]

[9204] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9205] Miyashita, H.; Nakagawara, K.; Mori, M.; Narushima, Y.; Noguchi, N.; Moriizumi, S.; Takasawa, S.; Yonekura, H.; Takeuchi, T.; Okamoto, H. : Human REG family genes are tandemly ordered in a 95- kilobase region of chromosome 2p12. FEBS Lett. 377: 429- 433, 1995. ; and

[9206] Moriizumi, S.; Watanabe, T.; Unno, M.; Nakagawara, K.; Suzuki, Y.; Miyashita, H.; Yonekura, H.; Okamoto, H. : Isolation, structural determination and expression of a novel reg gene, hum.

[9207] Further studies establishing the function and utilities of REGL are found in John Hopkins OMIM database record ID 167771, and in cited publications listed in Table 5, which are hereby incorporated by reference.Regulatory factor x,

1 (influences hla class ii expression) (RFX1, Accession NP_002909.2) is another GAM63 target gene, herein designated TARGET GENE. RFX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RFX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RFX1 BINDING SITE, designated SEQ ID:8417, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9208] Another function of GAM63 is therefore inhibition of Regulatory factor x, 1 (influences hla class ii expression) (RFX1, Accession NP_002909.2), a gene which regulates mhc class ii gene expression and also binds to an inverted repeat (enh1) required for hepatitis b virus genes expression. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFX1.

[9209] The function of RFX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.2.RGL (Accession NP_055964.2) is another GAM63 target gene, herein designated TARGET GENE. RGL

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RGL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RGL BINDING SITE, designated SEQ ID:13116, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9210] Another function of GAM63 is therefore inhibition of RGL (Accession NP_055964.2), a gene which is involved in nucleotide exchange factor. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGL.

[9211] The function of RGL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM51.1.RGL3 (Accession XP_290867.1) is another GAM63 target gene, herein designated TARGET GENE. RGL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RGL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

RGL3 BINDING SITE, designated SEQ ID:15226, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9212] Another function of GAM63 is therefore inhibition of RGL3 (Accession XP_290867.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGL3.

[9213] RGNEF (Accession NP_071893.1) is another GAM63 target gene, herein designated TARGET GENE. RGNEF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RGNEF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RGNEF BINDING SITE, designated SEQ ID:18858, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9214] Another function of GAM63 is therefore inhibition of RGNEF (Accession NP_071893.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGNEF.

[9215] RNF110 (Accession NP_009075.1) is another GAM63 target gene, herein designated TARGET GENE. RNF110 BIND-

ING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNF110, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF110 BINDING SITE, designated SEQ ID:17598, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9216] Another function of GAM63 is therefore inhibition of RNF110 (Accession NP_009075.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF110.

[9217] Ring finger protein 3 (RNF3, Accession NP_006306.2) is another GAM63 target gene, herein designated TARGET GENE. RNF3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RNF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF3 BINDING SITE, designated SEQ ID:6132, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9218] Another function of GAM63 is therefore inhibition of Ring finger protein 3 (RNF3, Accession NP_006306.2), a gene which is a mitogen- activated nuclear kinase involved in signal transduction. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF3.

[9219] The function of RNF3 has been established by previous studies. In a search for novel genes in the human major histocompatibility complex (MHC) class II region on chromosome 6p21.3, Okamoto et al. (1991) and Beck et al. (1992) identified a gene that they termed RING3 ('RING' is an acronym for 'really interesting new gene.'). Based on mapping and genomic sequencing, RING3 was located in the middle of the class II region between the genes HLA-DNA (OMIM Ref. No. 142930) and HLA- DMA (OMIM Ref. No. 142855). In contrast to all the other genes encoded in the class II region, RING3 appeared to have no obvious function associated with the immune system based on sequence comparisons. The striking sequence similarity to the female sterile homeotic (fsh) gene in Drosophila, however, suggested a conserved biologic function for RING3. Denis and Green (1996) discovered that the RING3 product is, in fact, a mitogen- activated nuclear kinase in-

volved in signal transduction and that it is upregulated in certain types of leukemia. With the aim of learning more about the phylogeny of RING3, Thorpe et al. (1996) identified further homologs in different species and determined their gene structures. The functional analysis of RING3 had been further complicated by the finding of a second, non- MHC- linked copy of RING3 in humans by Nomura et al. (1994). This was referred to by them as ORFX (OMIM Ref. No. 601541). Using a PCR probe derived from the ORFX cDNA sequence, Thorpe et al. (1996) mapped ORFX to 9q34 by fluorescence in situ hybridization analysis. Several other MHC- related genes had been reported to map to the same region of 9q

[9220]

[9221] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9222] Denis, G. V.; Green, M. R. : A novel, mitogen- activated nuclear kinase is related to a Drosophila developmental regulator. Genes Dev. 10: 261- 271, 1996. ; and

[9223] Nomura, N.; Nagase, T.; Miyajima, N.; Sazuka, T.; Tanaka, A.; Sato, S.; Seki, N.; Kawarabayasi, Y.; Ishikawa, K.; Tabata, S. : Prediction of the coding sequences of uniden-

tified human genes.

[9224] Further studies establishing the function and utilities of RNF3 are found in John Hopkins OMIM database record ID 601540, and in cited publications listed in Table 5, which are hereby incorporated by reference.RNTRE (Accession NP_055503.1) is another GAM63 target gene, herein designated TARGET GENE. RNTRE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNTRE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNTRE BINDING SITE, designated SEQ ID:17840, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9225] Another function of GAM63 is therefore inhibition of RNTRE (Accession NP_055503.1), a gene which may be involved in cell proliferation. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNTRE.

[9226] The function of RNTRE has been established by previous studies. Matoskova et al. (1996) demonstrated that the product of the RNTRE gene is a 97- to 100- kD protein that stably associates in vivo and in vitro with EPS8 via the

SH3 domain of the latter. In vitro, RNTRE displayed remarkable preference for binding to the SH3 domain of EPS8, compared with 8 other SH3s. A C- terminal truncated mutant of RNTRE was able to confer proliferative advantage and reduced serum requirement to NIH3T3 fibroblasts, suggesting a role for RNTRE in cell proliferation. Epidermal growth factor receptor (EGFR; 131550) signaling involves small GTPases of the Rho family, and EGFR trafficking involves small GTPases of the Rab family. Lanzetti et al. (2000) reported that the EPS8 protein connects these signaling pathways. EPS8 is a substrate of EGFR that is held in a complex with SOS1 (OMIM Ref. No. 182530) by the adaptor protein E3B1 (OMIM Ref. No. 603050), thereby mediating activation of RAC (OMIM Ref. No. 602048). Through its SH3 domain, EPS8 interacts with RNTRE. Lanzetti et al. (2000) showed that RNTRE is a RAB5 (OMIM Ref. No. 179512) GTPase- activating protein (GAP) whose activity is regulated by EGFR. By entering in a complex with EPS8, RNTRE acts on RAB5 and inhibits internalization of the EGFR. Furthermore, RNTRE diverts EPS8 from its RAC- activating function, resulting in the attenuation of RAC signaling. Thus, depending on its state of association with E3B1 or RNTRE, EPS8 participates in both EGFR

signaling through RAC and EGFR trafficking through RAB5. Lanzetti et al. (2000) showed that 2 arginine residues (arg106 and arg150 of RNTRE) are highly conserved in TRH domains. In addition, an aspartate residue (asp147 of RNTRE) is invariant. Mutations of any of these residues to alanine resulted in proteins that were unable to display GAP activity on RAB5.

[9227]

[9228] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9229] Lanzetti, L.; Rybin, V.; Malabarba, M. G.; Christoforidis, S.; Scita, G.; Zerial, M.; Di Fiore, P. P. : The Eps8 protein coordinates EGF receptor signalling through Rac and trafficking through Rab5. Nature 408: 374- 377, 2000. ; and

[9230] Matoskova, B.; Wong, W. T.; Seki, N.; Nagase, T.; Nomura, N.; Robbins, K. C.; Di Fiore, P. P. : RN- tre identifies a family of tre- related proteins displaying a novel potential protein bind.

[9231] Further studies establishing the function and utilities of RNTRE are found in John Hopkins OMIM database record ID 605405, and in cited publications listed in Table 5, which are hereby incorporated by reference.RoXaN

(Accession NP_060060.3) is another GAM63 target gene, herein designated TARGET GENE. RoXaN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RoXaN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RoXaN BINDING SITE, designated SEQ ID:18964, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9232] Another function of GAM63 is therefore inhibition of RoXaN (Accession NP_060060.3) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RoXaN.

[9233] RPC2 (Accession NP_060552.2) is another GAM63 target gene, herein designated TARGET GENE. RPC2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RPC2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPC2 BINDING SITE, designated SEQ ID:3735, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also desig-

nated SEQ ID:348.

[9234] Another function of GAM63 is therefore inhibition of RPC2 (Accession NP_060552.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPC2.

[9235] Ribosomal protein s6 kinase, 52kda, polypeptide 1 (RPS6KC1, Accession NP_036556.2) is another GAM63 target gene, herein designated TARGET GENE. RPS6KC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RPS6KC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPS6KC1 BINDING SITE, designated SEQ ID:8683, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9236] Another function of GAM63 is therefore inhibition of Ribosomal protein s6 kinase, 52kda, polypeptide 1 (RPS6KC1, Accession NP_036556.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KC1.

[9237] Related ras viral (r-ras) oncogene homolog 2 (RRAS2, Accession NP_036382.2) is another GAM63 target gene,

herein designated TARGET GENE. RRAS2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RRAS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RRAS2 BINDING SITE, designated SEQ ID:15394, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9238] Another function of GAM63 is therefore inhibition of Related ras viral (r-ras) oncogene homolog 2 (RRAS2, Accession NP_036382.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRAS2.

[9239] S100Z (Accession NP_570128.1) is another GAM63 target gene, herein designated TARGET GENE. S100Z BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by S100Z, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of S100Z BINDING SITE, designated SEQ ID:12017, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also

designated SEQ ID:348.

[9240] Another function of GAM63 is therefore inhibition of S100Z (Accession NP_570128.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100Z.

[9241] SAPAP3 (Accession XP_035601.2) is another GAM63 target gene, herein designated TARGET GENE. SAPAP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SAPAP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SAPAP3 BINDING SITE, designated SEQ ID:14421, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9242] Another function of GAM63 is therefore inhibition of SAPAP3 (Accession XP_035601.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAPAP3.

[9243] SC65 (Accession NP_006446.1) is another GAM63 target gene, herein designated TARGET GENE. SC65 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SC65, corresponding to a tar-

get binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SC65 BINDING SITE, designated SEQ ID:5594, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9244] Another function of GAM63 is therefore inhibition of SC65 (Accession NP_006446.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SC65.

[9245] Sodium channel, voltage gated, type viii, alpha polypeptide (SCN8A, Accession NP_055006.1) is another GAM63 target gene, herein designated TARGET GENE. SCN8A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCN8A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCN8A BINDING SITE, designated SEQ ID:1580, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9246] Another function of GAM63 is therefore inhibition of Sodium channel, voltage gated, type viii, alpha polypep-

tide (SCN8A, Accession NP_055006.1), a gene which is component of a brain voltage- gated sodium channel. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN8A.

[9247] The function of SCN8A has been established by previous studies. The dystonia demonstrated by Sprunger et al. (1999) in association with the Scn8a mutation was the first to be related to mutation in an ion channel. Furthermore, the med(J) mouse differed from other animal models with dystonia in that the condition persisted to adulthood and was not associated with neurodegeneration. Sprunger et al. (1999) suggested that the med(J) mutation should be classified as a hypomorphic allele because a low level of full- length Scn8a transcripts was demonstrated in homozygotes, indicating normal splicing at low efficiency. Homozygotes for null alleles of Scn8a could not survive even in the presence of 2 copies of the Scnm1(H) modifier allele. Thus, prevention of paralysis and survival to adulthood required both a low level of wildtype transcript and at least 1 copy of the dominant allele of Scnm1. C57BL/6J carries a recessive allele of Scmn1 that, in combination with a hypomorphic level of Scn8a, resulted in paralysis

and lethality. DeRepentigny et al. (2001) described a spontaneous autosomal recessive mutation in the mouse, which they termed 'degenerating muscle' (dmu), that is characterized by skeletal and cardiac muscle degeneration. Dmu mice are weak and have great difficulty in moving due to muscle atrophy and wasting in the hindquarters. Histopathologic observations and ultrastructural analysis revealed muscle degeneration in both skeletal and cardiac muscle, but no abnormalities in sciatic nerves. Using linkage analysis, the authors mapped the dmu locus to the distal portion of mouse chromosome 15 in a region syntenic to human chromosome 12q13. The human disorder scapuloperoneal myopathy (SPM; 181430) has been linked to this region, and SPM patients with associated cardiomyopathy have been described. Intact transcripts for Scn8a were present in dmu mice, but their levels were dramatically reduced. Furthermore, genetic complementation crosses between dmu and med mice revealed that they are allelic. The authors concluded that at least a portion of the dmu phenotype may be caused by a downregulation of Scn8a, and that SCN8A is a candidate gene for human SPM.

[9248]

[9249] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9250] Sprunger, L. K.; Escayg, A.; Tallaksen- Greene, S.; Albin, R. L.; Meisler, M. H. : Dystonia associated with mutation of the neuronal sodium channel Scn8a and identification of the modifier locus Scnm1 on mouse chromosome 3. Hum. Molec. Genet. 8: 471- 479, 1999. ; and

[9251] DeRepentigny, Y.; Cote, P. D.; Pool, M.; Bernier, G.; Girard, S.; Vidal, S. M.; Kothary, R. : Pathological and genetic analysis of the degenerating muscle (dmu) mouse: a new allele of Sc.

[9252] Further studies establishing the function and utilities of SCN8A are found in John Hopkins OMIM database record ID 600702, and in cited publications listed in Table 5, which are hereby incorporated by reference.Sidekick homolog 2 (chicken) (SDK2, Accession NP_061937.2) is another GAM63 target gene, herein designated TARGET GENE. SDK2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SDK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of SDK2 BINDING SITE, designated SEQ ID:16444, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9253] Another function of GAM63 is therefore inhibition of Sidekick homolog 2 (chicken) (SDK2, Accession NP_061937.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDK2.

[9254] SEC31B-1 (Accession NP_056305.1) is another GAM63 target gene, herein designated TARGET GENE. SEC31B-1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SEC31B-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEC31B-1 BINDING SITE, designated SEQ ID:19442, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9255] Another function of GAM63 is therefore inhibition of SEC31B-1 (Accession NP_056305.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC31B-1.

[9256] SELB (Accession NP_068756.1) is another GAM63 target

gene, herein designated TARGET GENE. SELB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SELB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SELB BINDING SITE, designated SEQ ID:7377, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9257] Another function of GAM63 is therefore inhibition of SELB (Accession NP_068756.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELB.

[9258] Serine (or cysteine) proteinase inhibitor, clade b (ovalbumin), member 5 (SERPINB5, Accession NP_002630.1) is another GAM63 target gene, herein designated TARGET GENE. SERPINB5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SERPINB5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SERPINB5 BINDING SITE, designated SEQ ID:8247, to the nucleotide sequence of

GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9259] Another function of GAM63 is therefore inhibition of Serine (or cysteine) proteinase inhibitor, clade b (ovalbumin), member 5 (SERPINB5, Accession NP_002630.1), a gene which may be a serpin serine protease inhibitor and supresses tumor metastasis. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB5.

[9260] The function of SERPINB5 has been established by previous studies. The nucleotide 5- methylcytosine is involved in processes crucial to mammalian development, such as X- chromosome inactivation and gene imprinting. In addition, cytosine methylation may be involved in the establishment and maintenance of cell type- specific expression of developmentally regulated genes; however, it is difficult to identify clear examples of such genes, particularly in humans. Futscher et al. (2002) provided evidence that cytosine methylation of the maspin gene promoter controls, in part, normal cell type- specific SERPINB5 expression. In normal cells expressing SERPINB5, the SERPINB5 promoter is unmethylated and the promoter region has acetylated histones and an accessible chromatin

structure. In contrast, normal cells that do not express SERPINB5 have a completely methylated SERPINB5 promoter with hypoacetylated histones, an inaccessible chromatin structure, and a transcriptional repression that is relieved by inhibition of DNA methylation. These findings indicated that cytosine methylation is important in the establishment and maintenance of cell type- restricted gene expression. Zou et al. (1994) used subtractive hybridization and the 'differential display' method to identify candidate tumor suppressor genes that are defective in human breast carcinoma cells. These genes were identified initially by searching for mRNAs whose expression is reduced or absent in tumor cells compared with normal cells grown under similar conditions. Zou et al. (1994) reported the characteristics of one of the more than 30 genes so identified, a member of the serpin family of protease inhibitors which they termed maspin. A single 3.0-kb maspin mRNA was expressed in normal mammary epithelial cell strains, but not in most mammary tumor cell lines examined. Southern blot analysis of XbaI- restricted DNA from normal and tumor cells with a maspin cDNA probe revealed no gross structural alterations of the maspin gene in the tumor cells. This result suggested that

the maspin gene is downregulated but not mutated in cancer cells. Transfection of mammary carcinoma cells with the maspin gene did not alter the growth properties of the cells in vitro, but reduced their ability to induce tumors and metastasize in nude mice and to invade through a basement membrane matrix in vitro. Analysis of human breast cancer specimens demonstrated that loss of maspin expression occurred most frequently in advanced cancers. These results supported the hypothesis that maspin functions as a tumor suppressor.

[9261]

[9262] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9263] Zou, Z.; Anisowicz, A.; Hendrix, M. J. C.; Thor, A.; Neveu, M.; Sheng, S.; Rafidi, K.; Seftor, E.; Sager, R. : Maspin, a serpin with tumor- suppressing activity in human mammary epithelial cells. Science 263: 526- 529, 1994. ; and

[9264] Futscher, B. W.; Oshiro, M. M.; Wozniak, R. J.; Holtan, N.; Hanigan, C. L.; Duan, H.; Domann, F. E. : Role for DNA methylation in the control of cell type- specific maspin expression. Nat.

[9265] Further studies establishing the function and utilities of

SERPINB5 are found in John Hopkins OMIM database record ID 154790, and in cited publications listed in Table 5, which are hereby incorporated by reference.Splicing factor 3b, subunit 3, 130kda (SF3B3, Accession NP_036558.1) is another GAM63 target gene, herein designated TARGET GENE. SF3B3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SF3B3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SF3B3 BINDING SITE, designated SEQ ID:10702, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9266] Another function of GAM63 is therefore inhibition of Splicing factor 3b, subunit 3, 130kda (SF3B3, Accession NP_036558.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SF3B3.

[9267] Short stature homeobox (SHOX, Accession NP_000442.1) is another GAM63 target gene, herein designated TARGET GENE. SHOX BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SHOX, corresponding to a target bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SHOX BINDING SITE, designated SEQ ID:10815, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9268] Another function of GAM63 is therefore inhibition of Short stature homeobox (SHOX, Accession NP_000442.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHOX.

[9269] Sialyltransferase 1 (beta-galactoside alpha-2,6-sialytransferase) (SIAT1, Accession NP_775324.1) is another GAM63 target gene, herein designated TARGET GENE. SIAT1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT1 BINDING SITE, designated SEQ ID:17508, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9270] Another function of GAM63 is therefore inhibition of Sialyltransferase 1 (beta-galactoside alpha-2,6-sialytransferase) (SIAT1, Accession NP_775324.1), a gene which transfers sialic acid from the donor of substrate cmp- sialic acid to galactose containing acceptor substrates. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT1.

[9271] The function of SIAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.2.Sialyltransferase 1 (beta-galactoside alpha-2,6-sialytransferase) (SIAT1, Accession NP_775323.1) is another GAM63 target gene, herein designated TARGET GENE. SIAT1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT1 BINDING SITE, designated SEQ ID:17508, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9272] Another function of GAM63 is therefore inhibition of Sialyltransferase 1 (beta-galactoside alpha-2,6-sialytransferase) (SIAT1, Accession NP_775323.1), a gene which transfers sialic acid from the donor of substrate cmp- sialic acid to galactose containing acceptor substrates. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT1.

[9273] The function of SIAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.2.Sialyltransferase 1 (beta-galactoside alpha-2,6-sialytransferase) (SIAT1, Accession NP_003023.1) is another GAM63 target gene, herein designated TARGET GENE. SIAT1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT1 BINDING SITE, designated SEQ ID:17508, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9274] Another function of GAM63 is therefore inhibition of Sialyltransferase 1 (beta-galactoside alpha-2,6-sialytransferase) (SIAT1, Accession NP_003023.1), a gene which transfers sialic acid from the donor of substrate cmp- sialic acid to galactose containing acceptor substrates. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT1.

[9275] The function of SIAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.2.Sialyltransferase 8e (alpha-2, 8-polysialytransferase) (SIAT8E, Accession NP_037437.2) is another GAM63 target gene, herein designated TARGET GENE. SIAT8E BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SIAT8E, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT8E BINDING SITE, designated SEQ ID:20017, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9276] Another function of GAM63 is therefore inhibition of Sia-

lyltransferase 8e (alpha-2, 8-polysialytransferase) (SIAT8E, Accession NP_037437.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT8E.

[9277] Sialic acid binding ig-like lectin 8 (SIGLEC8, Accession NP_055257.1) is another GAM63 target gene, herein designated TARGET GENE. SIGLEC8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SIGLEC8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIGLEC8 BINDING SITE, designated SEQ ID:7604, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9278] Another function of GAM63 is therefore inhibition of Sialic acid binding ig-like lectin 8 (SIGLEC8, Accession NP_055257.1), a gene which is a cell adhesion molecule for postnatal neural development. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIGLEC8.

[9279] The function of SIGLEC8 has been established by previous studies. By searching an EST database for sequences simi-

lar to CD33, Floyd et al. (2000) identified a cDNA from an eosinophil cDNA library encoding SIGLEC8. Sequence analysis predicted that like other SIGLECs, the 431- amino acid, type 1 transmembrane protein contains a signal peptide, an N- terminal V- set domain, and 2 C2- set domains, as well as 3 potential N- linked glycosylation sites and a transmembrane region; however, SIGLEC8 has a truncated 47- residue cytoplasmic tail lacking the conserved tyrosine- based motifs. Binding analysis confirmed that SIGLEC8 binds to red blood cell sialic acids with a preference for 3- prime over 6- prime sialyllactose- conjugated polyacrylamide. FACS and immunoprecipitation analyses demonstrated SIGLEC8 expression on eosinophils but not other leukocytes as a 45- and 89- kD dimer. Kikly et al. (2000) also cloned SIGLEC8, which they termed SAF2 (sialoadhesin (OMIM Ref. No. 600751) family member- 2). Flow cytometric analysis detected strong expression on eosinophils and mast cells and weak but detectable expression on basophils.

[9280]

[9281] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9282] Floyd, H.; Ni, J.; Cornish, A. L.; Zeng, Z.; Liu, D.; Carter, K. C.; Steel, J.; Crocker, P. R. : Siglec- 8: a novel eosinophil-specific member of the immunoglobulin superfamily. J. Biol. Chem. 275: 861- 866, 2000. ; and

[9283] Kikly, K. K.; Bochner, B. S.; Freeman, S. D.; Tan, K. B.; Gallagher, K. T.; D'alessio, K. J.; Holmes, S. D.; Abrahamson, J. A.; Erickson- Miller, C. L.; Murdock, P. R.; Tachimoto, H.; Schl.

[9284] Further studies establishing the function and utilities of SIGLEC8 are found in John Hopkins OMIM database record ID 605639, and in cited publications listed in Table 5, which are hereby incorporated by reference.Src-like-adaptor (SLA, Accession NP_006739.1) is another GAM63 target gene, herein designated TARGET GENE. SLA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLA BINDING SITE, designated SEQ ID:8297, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9285] Another function of GAM63 is therefore inhibition of Src-

like-adaptor (SLA, Accession NP_006739.1), a gene which is a negative regulator of T- cell receptor signaling. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLA.

[9286] The function of SLA has been established by previous studies. Pandey et al. (1995) isolated a mouse cDNA using the 2- hybrid system to screen for molecules that interact with the cytoplasmic domain of Eck, a mouse receptor protein kinase (OMIM Ref. No. 176946). The predicted 281- amino acid protein has both SH3 and SH2 adaptor motifs similar to those in the Src family of nonreceptor tyrosine kinases but had no catalytic domain. The protein was named Slap (Src- like adaptor protein) by the authors. Recombinant Slap was shown to bind to activated Eck receptor tyrosine kinase. Angrist et al. (1995) cloned a cDNA for the putative human homolog of the gene, symbolized SLA. The predicted protein has 87% overall identity to the mouse sequence. Sosinowski et al. (2000) showed that SLA is a negative regulator of T- cell receptor signaling. Holland et al. (2001) demonstrated that SLA and SLA2 (OMIM Ref. No. 606577) are both involved in downregulating T and B cell- mediated responses.

[9287]

[9288] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9289] Angrist, M.; Wells, D. E.; Chakravarti, A.; Pandey, A. : Chromosomal localization of the mouse Src- like adapter protein (Slap) gene and its putative human homolog SLA. Genomics 30: 623- 625, 1995. ; and

[9290] Sosinowski, T.; Pandey, A.; Dixit, V. M.; Weiss, A. : Src-like adaptor protein (SLAP) is a negative regulator of T cell receptor signaling. J. Exp. Med. 191: 463- 474, 2000.

[9291] Further studies establishing the function and utilities of SLA are found in John Hopkins OMIM database record ID 601099, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 16 (monocarboxylic acid transporters), member 2 (putative transporter) (SLC16A2, Accession NP_006508.1) is another GAM63 target gene, herein designated TARGET GENE. SLC16A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC16A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of SLC16A2 BINDING SITE, designated SEQ ID:12766, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9292] Another function of GAM63 is therefore inhibition of Solute carrier family 16 (monocarboxylic acid transporters), member 2 (putative transporter) (SLC16A2, Accession NP_006508.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A2.

[9293] Solute carrier family 21 (organic anion transporter), member 3 (SLC21A3, Accession NP_602307.1) is another GAM63 target gene, herein designated TARGET GENE. SLC21A3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SLC21A3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC21A3 BINDING SITE, designated SEQ ID:7376, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9294] Another function of GAM63 is therefore inhibition of Solute carrier family 21 (organic anion transporter), member

3 (SLC21A3, Accession NP_602307.1), a gene which mediates the na(+)- independent transport of organic anions such as bsp and conjugated (taurocholate) and unconjugated (cholate) bile acids. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A3.

[9295] The function of SLC21A3 has been established by previous studies. The organic anion transporter (OATP) of liver mediates the basolateral hepatocellular uptake of numerous cholephilic anions and steroidal compounds from sinusoidal blood. By screening a human liver cDNA library with a rat Oatp cDNA, Kullak- Ublick et al. (1995) cloned a cDNA encoding OATP. The deduced 670- amino acid OATP protein has 12 putative transmembrane domains and 8 potential N- linked glycosylation sites. The human and rat OATP proteins are 67% identical. In vitro translation produced unglycosylated and glycosylated human OATP proteins that migrated as 59- kD and 71- kD polypeptides, respectively, in SDS- polyacrylamide gels. Functional studies in Xenopus oocytes showed that OATP mediates sodium- independent transport of the xenobiotic bromosulfophthalein and of endogenous conjugated and unconjugated bile acids. Northern blot analysis de-

tected an approximately 2.7- kb OATP transcript in human liver, brain, lung, kidney, and testis; additional transcripts were also observed. The authors stated that the extrahepatic expression of OATP suggests a general role for OATP in transepithelial organic anion transport

[9296]

[9297] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Northern blot analysis detected an approximately 2.7- kb OATP transcript in human liver, brain, lung, kidney, and testis; additional transcripts were also observed. The authors stated that the extrahepatic expression of OATP suggests a general role for OATP in transepithelial organic anion transport

[9303]

[9304] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9305] Kullak- Ublick, G. A.; Hagenbuch, B.; Stieger, B.; Schteingart, C. D.; Hofmann, A. F.; Wolkoff, A. W.; Meier, P. J. :

Molecular and functional characterization of an organic anion transporting polypeptide cloned from human liver. :Gastroenterology 109: 1274- 1282, 1995. ; and

[9306] By somatic cell hybrid analysis, Kullak- Ublick et al. (1995) mapped the SLC21A3 gene to chromosome 12. Kullak-Ublick et al. (1996) regionally localized the SLC21A3 gene to 12p12 using fluor.

[9307] Further studies establishing the function and utilities of SLC21A3 are found in John Hopkins OMIM database record ID 602883, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 24 (sodium/potassium/calcium exchanger), member 3 (SLC24A3, Accession XP_300245.1) is another GAM63 target gene, herein designated TARGET GENE. SLC24A3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SLC24A3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC24A3 BINDING SITE, designated SEQ ID:3098, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9308] Another function of GAM63 is therefore inhibition of Solute carrier family 24 (sodium/potassium/calcium exchanger), member 3 (SLC24A3, Accession XP_300245.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC24A3.

[9309] Solute carrier family 24 (sodium/potassium/calcium exchanger), member 3 (SLC24A3, Accession NP_065740.2) is another GAM63 target gene, herein designated TARGET GENE. SLC24A3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SLC24A3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC24A3 BINDING SITE, designated SEQ ID:3098, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9310] Another function of GAM63 is therefore inhibition of Solute carrier family 24 (sodium/potassium/calcium exchanger), member 3 (SLC24A3, Accession NP_065740.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with SLC24A3.

[9311] Solute carrier family 25, member 13 (citrin) (SLC25A13, Accession NP_055066.1) is another GAM63 target gene, herein designated TARGET GENE. SLC25A13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC25A13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC25A13 BINDING SITE, designated SEQ ID:1680, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9312] Another function of GAM63 is therefore inhibition of Solute carrier family 25, member 13 (citrin) (SLC25A13, Accession NP_055066.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC25A13.

[9313] Solute carrier family 26, member 10 (SLC26A10, Accession NP_597996.1) is another GAM63 target gene, herein designated TARGET GENE. SLC26A10 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC26A10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC26A10 BINDING SITE, designated SEQ ID:1293, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9314] Another function of GAM63 is therefore inhibition of Solute carrier family 26, member 10 (SLC26A10, Accession NP_597996.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A10.

[9315] Solute carrier family 39 (zinc transporter), member 4 (SLC39A4, Accession NP_060237.1) is another GAM63 target gene, herein designated TARGET GENE. SLC39A4 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by SLC39A4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC39A4 BINDING SITE, designated SEQ ID:9715, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9316] Another function of GAM63 is therefore inhibition of Solute carrier family 39 (zinc transporter), member 4

(SLC39A4, Accession NP_060237.1), a gene which is a zinc transporter and therefore may be associated with Acrodermatitis enteropathica. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Acrodermatitis enteropathica, and of other diseases and clinical conditions associated with SLC39A4.

[9317] The function of SLC39A4 has been established by previous studies. The SLC39A4 gene encodes a protein with significant similarity to members of the zinc/iron- regulated transporter- like protein (ZIP) family, which are thought to be involved in zinc uptake in Arabidopsis thaliana and humans. Rogers et al. (2000) studied the Arabidopsis root membrane protein IRT1, which is likely to be responsible for uptake of iron from the soil. It also transports other cations, including the essential metals zinc and manganese. By heterologous expression in yeast, Rogers et al. (2000) showed that replacement of a glutamic acid residue at position 103 of wildtype IRT1 with alanine increased the substrate specificity of the transporter by selectively eliminating its ability to transport zinc. Other amino acid substitutions in this protein of the ZIP gene family caused other changes in specificity.

[9318]

[9319] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9320] Rogers, E. E.; Eide, D. J.; Guerinot, M. L. : Altered selectivity in an Arabidopsis metal transporter. Proc. Nat. Acad. Sci. 97: 12356- 12360, 2000. ; and

[9321] Wang, K.; Zhou, B.; Kuo, Y.- M.; Zemansky, J.; Gitschier, J. : A novel member of a zinc transporter family is defective in acrodermatitis enteropathica. Am. J. Hum. Genet. 71: 66- 73, 2002.

[9322] Further studies establishing the function and utilities of SLC39A4 are found in John Hopkins OMIM database record ID 607059, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 6 (neurotransmitter transporter, gaba), member 13 (SLC6A13, Accession NP_057699.2) is another GAM63 target gene, herein designated TARGET GENE. SLC6A13 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC6A13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC6A13 BINDING SITE, designated SEQ ID:4114, to the

nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9323] Another function of GAM63 is therefore inhibition of Solute carrier family 6 (neurotransmitter transporter, gaba), member 13 (SLC6A13, Accession NP_057699.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A13.

[9324] Solute carrier family 6 (neurotransmitter transporter, noradrenalin), member 2 (SLC6A2, Accession NP_001034.1) is another GAM63 target gene, herein designated TARGET GENE. SLC6A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC6A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC6A2 BINDING SITE, designated SEQ ID:6372, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9325] Another function of GAM63 is therefore inhibition of Solute carrier family 6 (neurotransmitter transporter, noradrenalin), member 2 (SLC6A2, Accession NP_001034.1), a gene which binds to gt and gc boxes promoters elements.

Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A2.

[9326] The function of SLC6A2 has been established by previous studies. identifying a new gene family for neurotransmitter transporter proteins. Pacholczyk et al. (1991) suggested that analysis of the structure and function of this transporter may aid structure- based drug design for the treatment of human depression and lead to a determination of whether transporter abnormalities underlie affective disorders. Long- term weight- restored patients with anorexia nervosa (OMIM Ref. No. 606788) have lower norepinephrine levels than controls (Kaye et al., 1985; Pirke et al., 1992). Since this may reflect altered reuptake by the norepinephrine transporter, Urwin et al. (2002) hypothesized that the NET gene may be involved in the genetic component of anorexia nervosa. PCR amplification of an AAGG repeat island (AAGG1) in the NET gene promoter region revealed a novel 343- bp sequence with 5 additional AAGG repeat islands (AAGG2- AAGG6). The sequence from AAGG1 to AAGG6, inclusive, was designated the NET gene promoter polymorphic region. A 4- bp deletion or insertion in AAGG4 resulted in the net loss or gain,

respectively, of a putative Elk1 transcription factor site. The transmission disequilibrium test with 87 Australian trios (patient plus parents) demonstrated significant preferential transmission of the 4- bp insertion from parent to child with restricting anorexia nervosa (RAN), suggesting that this allele, or a DNA variant in linkage disequilibrium with it, doubles the risk for developing RAN.

[9327]

[9328] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9329] Pacholczyk, T.; Blakely, R. D.; Amara, S. G. : Expression cloning of a cocaine- and antidepressant- sensitive human noradrenaline transporter. Nature 350: 350- 354, 1991. ; and

[9330] Urwin, R. E.; Bennetts, B.; Wilcken, B.; Lampropoulos, B.; Beumont, P.; Clarke, S.; Russell, J.; Tanner, S.; Nunn, K. P. : Anorexia nervosa (restrictive subtype) is associated with a poly.

[9331] Further studies establishing the function and utilities of SLC6A2 are found in John Hopkins OMIM database record ID 163970, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier

family 9 (sodium/hydrogen exchanger), isoform 1 (antiporter, na+/h+, amiloride sensitive) (SLC9A1, Accession NP_003038.2) is another GAM63 target gene, herein designated TARGET GENE. SLC9A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC9A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC9A1 BINDING SITE, designated SEQ ID:9899, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9332] Another function of GAM63 is therefore inhibition of Solute carrier family 9 (sodium/hydrogen exchanger), isoform 1 (antiporter, na+/h+, amiloride sensitive) (SLC9A1, Accession NP_003038.2), a gene which is involved in ph regulation to eliminate acids generated by active metabolism or to counter adverse environmental conditions. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A1.

[9333] The function of SLC9A1 has been established by previous studies. Denker et al. (2000) showed that the plasma

membrane ion exchanger NHE1 acts as an anchor for actin filaments to control the integrity of the cortical cytoskeleton. This occurs through a previously unrecognized structural link between NHE1 and the actin- binding proteins ezrin (OMIM Ref. No. 123900), radixin (OMIM Ref. No. 179410), and moesin (OMIM Ref. No. 309845), which are collectively referred to as ERM proteins. NHE1 and ERM proteins were found to associate directly and colocalize in lamellipodia. Fibroblasts expressing NHE1 with mutations that disrupted binding with ERM proteins but not ion translocation had impaired organization of focal adhesions and actin stress fibers and an irregular cell shape. Denker et al. (2000) proposed a structural role for NHE1 in regulating the cortical cytoskeleton that is independent of its function as an ion exchanger. The genomic probe reported by Mattei et al. (1987) was used to map the APNH gene to 1p36.1- p35 by in situ hybridization (Mattei et al., 1988). Mattei et al. (1989) used in situ hybridization of the human cDNA probe to map the antiporter gene to the distal portion of mouse chromosome 4 and to the long arm of Chinese hamster chromosome 2, confirming the conserved homology between the distal part of human chromosome 1p, the mouse distal 4, and Chinese hamster

distal 2q. By the analysis of fragment length variations in recombinant inbred strains, Morahan and Rakar (1993) likewise mapped the Nhe1 gene to mouse chromosome 4, between Lck and Akp2. Lifton et al. (1990) used genomic clones of the SLC9A1 gene to identify 2 polymorphisms. Using these RFLPs in 59 reference families, they found that the antiporter gene lies 3 cM proximal to the RH locus. Dudley et al. (1990) PCR- amplified a 376- bp fragment corresponding to the 5- prime end of SLC9A1 and detected a polymorphism within this fragment by denaturing gradient gel electrophoresis. By genetic linkage studies, they mapped SLC9A1 telomeric to D1S57 and close to RH (OMIM Ref. No. 111700) and ALPL (OMIM Ref. No. 171760). They pointed out that SLC9A1 is a plausible candidate gene for human essential hypertension.

[9334]

[9335] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9336] Denker, S. P.; Huang, D. C.; Orlowski, J.; Furthmayr, H.; Barber, D. L. : Direct binding of the Na- H exchanger NHE1 to ERM proteins regulates the cortical cytoskeleton and cell shape independently of H(+) translocation. Molec.

Cell 6: 1425- 1436, 2000. ; and

[9337] Dudley, C. R. K.; Giuffra, L. A.; Tippett, P.; Kidd, K. K.; Reeders, S. T. : The Na+/H+ antiporter: a 'melt' polymorphism allows regional mapping to the short arm of chromosome 1. Hum. G.

[9338] Further studies establishing the function and utilities of SLC9A1 are found in John Hopkins OMIM database record ID 107310, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 9 (sodium/hydrogen exchanger), isoform 3 regulatory factor 1 (SLC9A3R1, Accession NP_004243.1) is another GAM63 target gene, herein designated TARGET GENE. SLC9A3R1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC9A3R1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC9A3R1 BINDING SITE, designated SEQ ID:10906, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9339] Another function of GAM63 is therefore inhibition of Solute carrier family 9 (sodium/hydrogen exchanger), isoform 3 regulatory factor 1 (SLC9A3R1, Accession

NP_004243.1), a gene which is the regulatory cofactor of the NHE3 (SLC9A3) sodium/hydrogen antiporter. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A3R1.

[9340] The function of SLC9A3R1 has been established by previous studies. Murthy et al. (1998) isolated SLC9A3R1, which they termed NHERF, by screening a fetal frontal cortex cDNA library using a yeast 2- hybrid system with merlin as bait. Northern blot analysis revealed that SLC9A3R1 is ubiquitously expressed, with highest levels in kidney, liver, and pancreas. Deletion and mutation analyses showed that SLC9A3R1 associates with the N terminus but not with the C terminus of merlin. SLC9A3R1 was also shown to bind to moesin and radixin at the N terminus, the region with the most homology to merlin. Using immunocytochemistry, Murthy et al. (1998) demonstrated that SLC9A3R1 colocalizes with moesin at the ruffling membrane, microvilli, and filopodia in HeLa cells

[9341] Animal model experiments lend further support to the function of SLC9A3R1. Shenolikar et al. (2002) found that targeted disruption of the mouse Nherf1 gene eliminated Nherf1 expression in kidney and other tissues of the mu-

tant mice without altering Nherf2 levels in these tissues. Heterozygous and homozygous deficient male mice maintained normal blood electrolytes but showed increased urinary excretion of phosphate when compared with homozygous wildtype animals. Although the overall levels of renal Nherf1 targets, Slc9a3 and sodium- phosphate transport- 2 (Npt2; 182309), were unchanged in the mutant mice, immunocytochemistry showed that the Npt2 protein was aberrantly localized at internal sites in the renal proximal tubule cells. The mislocalization of Npt2 paralleled a reduction in the transporter protein in renal brush- border membranes isolated from the mutant mice. In contrast, Slc9a3 was appropriately localized at the apical surface of proximal tubules in both wildtype and mutant mice. These data suggested that NHERF1 plays a unique role in the apical targeting and/or trafficking of NPT2 in the mammalian kidney, a function not shared by NHERF2 or other renal PDZ proteins. Phosphate wasting seen in the Nherf1 homozygous null mice provided a novel experimental system for defining the role of PDZ adaptors in the hormonal control of ion transport and renal disease

[9342] It is appreciated that the abovementioned animal model

for SLC9A3R1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[9343] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9344] Shenolikar, S.; Voltz, J. W.; Minkoff, C. M.; Wade, J. B.; Weinman, E. J. : Targeted disruption of the mouse NHERF- 1 gene promotes internalization of proximal tubule sodium- phosphate cotransporter type IIa and renal phos- phate wasting. Proc. Nat. Acad. Sci. 99: 11470- 11475, 2002. ; and

[9345] Murthy, A.; Gonzalez- Agosti, C.; Cordero, E.; Pinney, D.; Candia, C.; Solomon, F.; Gusella, J.; Ramesh, V. : NHE- RF, a regulatory cofactor for Na(+)- H(+) exchange, is a com- mon interactor f.

[9346] Further studies establishing the function and utilities of SLC9A3R1 are found in John Hopkins OMIM database record ID 604990, and in cited publications listed in Table 5, which are hereby incorporated by reference.Swi/snf re- lated, matrix associated, actin dependent regulator of chromatin, subfamily d, member 1 (SMARCD1, Accession NP_620710.1) is another GAM63 target gene, herein des-

ignated TARGET GENE. SMARCD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SMARCD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMARCD1 BINDING SITE, designated SEQ ID:12120, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9347] Another function of GAM63 is therefore inhibition of Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily d, member 1 (SMARCD1, Accession NP_620710.1), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD1.

[9348] The function of SMARCD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM42.1.Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily d, member 1 (SMARCD1, Accession NP_003067.2) is another GAM63 target gene, herein designated TARGET GENE. SMARCD1

BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SMARCD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMARCD1 BINDING SITE, designated SEQ ID:12120, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9349] Another function of GAM63 is therefore inhibition of Swi/snf related, matrix associated, actin dependent regulator of chromatin, subfamily d, member 1 (SMARCD1, Accession NP_003067.2), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD1.

[9350] The function of SMARCD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM42.1.Smcx homolog, x chromosome (mouse) (SMCX, Accession NP_004178.1) is another GAM63 target gene, herein designated TARGET GENE. SMCX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SMCX, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMCX BINDING SITE, designated SEQ ID:18708, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9351] Another function of GAM63 is therefore inhibition of Smcx homolog, x chromosome (mouse) (SMCX, Accession NP_004178.1), a gene which escapes X inactivation. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCX.

[9352] The function of SMCX has been established by previous studies. Agulnik et al. (1994) cloned a gene, designated Smcx, from the mouse X chromosome by its homology to the Y- located gene Smcy. Using direct in situ hybridization, Smcx was mapped to the distal end of the mouse X chromosome (XF2- XF4) and its human homolog, SMCX, was mapped to proximal Xp (Xp11.2- p11.1). Meiotic mapping in the mouse placed Smcx in the interval between Plp and Pdha1. Agulnik et al. (1994) showed that the Smcx gene escapes X inactivation; in hamster/human hybrids, it was expressed when either an active or an in-

active human X chromosome was present. Furthermore, 2 alleles of Smcx were found to be expressed in t(16;X)16H female mice despite the intact X chromosome being inactive in all cells. Thus, Smcx is also not subject to X inactivation. Agulnik et al. (1994) stated that this was the first example in the mouse of a gene that escapes X inactivation. Brown et al. (1995) demonstrated that the DXS423E gene (OMIM Ref. No. 300040), which is also located on Xp11.22- p11.21, likewise escapes X chromosome inactivation. Thus, the DXS423E and XE169 genes define a new region in the proximal short arm of the X chromosome that is not subject to X chromosome inactivation. Lingenfelter et al. (1998) showed that Smcx is susceptible to complete X inactivation in a portion of mouse embryonic cells. Furthermore, Smcx inactivation persists in some cells at least until 13.5 days postcoitum. A highly variable Smcx expression found during mouse development progressively disappears in adult tissues where nearly equal expression between alleles is observed

[9353]

[9354] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9355] Agulnik, A. I.; Mitchell, M. J.; Mattei, M.- G.; Borsani, G.; Avner, P. A.; Lerner, J. L.; Bishop, C. E. : A novel X gene with a widely transcribed Y- linked homologue escapes X-inactivation in mouse and human. Hum. Molec. Genet. 3: 879- 884, 1994. ; and

[9356] Lingenfelter, P. A.; Adler, D. A.; Poslinski, D.; Thomas, S.; Elliott, R. W.; Chapman, V. M.; Disteche, C. M. : Escape from X inactivation of Smcx is preceded by silencing dur-ing mouse deve.

[9357] Further studies establishing the function and utilities of SMCX are found in John Hopkins OMIM database record ID 314690, and in cited publications listed in Table 5, which are hereby incorporated by reference.SNRK (Accession NP_060189.2) is another GAM63 target gene, herein des-ignated TARGET GENE. SNRK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNRK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNRK BINDING SITE, designated SEQ ID:17487, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9358] Another function of GAM63 is therefore inhibition of SNRK

(Accession NP_060189.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNRK.

[9359] Sorting nexin 7 (SNX7, Accession NP_689424.1) is another GAM63 target gene, herein designated TARGET GENE. SNX7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNX7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNX7 BINDING SITE, designated SEQ ID:16240, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9360] Another function of GAM63 is therefore inhibition of Sorting nexin 7 (SNX7, Accession NP_689424.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX7.

[9361] Sorting nexin 7 (SNX7, Accession NP_057060.1) is another GAM63 target gene, herein designated TARGET GENE. SNX7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNX7, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNX7 BINDING SITE, designated SEQ ID:16240, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9362] Another function of GAM63 is therefore inhibition of Sorting nexin 7 (SNX7, Accession NP_057060.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX7.

[9363] Sry (sex determining region y)-box 9 (campomelic dysplasia, autosomal sex-reversal) (SOX9, Accession NP_000337.1) is another GAM63 target gene, herein designated TARGET GENE. SOX9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SOX9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SOX9 BINDING SITE, designated SEQ ID:14587, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9364] Another function of GAM63 is therefore inhibition of Sry (sex determining region y)-box 9 (campomelic dysplasia,

autosomal sex-reversal) (SOX9, Accession NP_000337.1), a gene which regulates the expression of other genes involved in chondrogenesis. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX9.

[9365] The function of SOX9 has been established by previous studies. Murakami et al. (2000) showed that expression of Sox9 is upregulated by fibroblast growth factors (FGFs; OMIM Ref. No. 601513) in primary chondrocytes and in Sox9- expressing mesenchymal cells. They further presented evidence that FGF stimulation of Sox9 expression is mediated by the mitogen- activated protein kinase (MAPK) cascade (see OMIM Ref. No. 176948) a signal transduction pathway that is activated by growth factors such as FGF. The data strongly suggested that FGF and the MAPK pathway play an important role in the regulation of Sox9 expression during chondrocyte differentiation, Bi et al. (2001) proposed that Sox9 also has a role in regulating the transition to hypertrophic chondrocytes in the growth plate. Despite the severe hypoplasia of cartilages, the overall organization and cellular composition of the growth plate were otherwise normal. The results suggested that 2 critical steps of the chondrocyte differentia-

tion pathway are sensitive to Sox9 dosage: an early step presumably at the stage of mesenchymal condensation of cartilage primordia, and a later step preceding the transition of chondrocytes into hypertrophic chondrocytes.

[9366]

[9367] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9368] Murakami, S.; Kan, M.; McKeehan, W. L.; de Crombrugghe, B. : Up- regulation of the chondrogenic Sox9 gene by fibroblast growth factors is mediated by the mitogen- activated protein kinase pathway. Proc. Nat. Acad. Sci. 97: 1113- 1118, 2000. ; and

[9369] Bi, W.; Huang, W.; Whitworth, D. J.; Deng, J. M.; Zhang, Z.; Behringer, R. R.; de Crombrugghe, B. : Haploinsufficiency of Sox9 results in defective cartilage primordia and premature skelet.

[9370] Further studies establishing the function and utilities of SOX9 are found in John Hopkins OMIM database record ID 114290, and in cited publications listed in Table 5, which are hereby incorporated by reference.Synovial sarcoma, x breakpoint 1 (SSX1, Accession NP_005626.1) is another GAM63 target gene, herein designated TARGET GENE.

SSX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SSX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SSX1 BINDING SITE, designated SEQ ID:2767, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9371] Another function of GAM63 is therefore inhibition of Synovial sarcoma, x breakpoint 1 (SSX1, Accession NP_005626.1), a gene which may act as a modulator of transcription. and therefore may be associated with Synovial sarcoma. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Synovial sarcoma., and of other diseases and clinical conditions associated with SSX1.

[9372] The function of SSX1 has been established by previous studies. Synovial sarcoma, according to the experience of Enzinger and Weiss (1983), is the fourth most common type of soft tissue sarcoma. It usually develops in adolescents and young adults, is more common in males than in females, and has no racial predilection. Turc- Carel et al. (1987) found a translocation involving chromosome X

(band p11.2) and chromosome 18 (band q11.2) in short-term cultures of cells from 5 synovial sarcomas and 1 malignant fibrous histiocytoma. In 4 of the tumors, the translocation t(X;18)(p11.2;q11.2) was reciprocal. The 2 other tumors had complex translocations, which, however, always involved chromosomes X and 18 at the 2 sites mentioned. The X;18 translocation was not detected in other histologic types of soft tissue sarcoma. This was the first description of a sex chromosome abnormality in a human solid tumor. Griffin and Emanuel (1987) confirmed the original findings of Turc- Carel et al. (1987). The karyotype of the tumor in their patient was 46,XX,t(X;18)(p11;q11). It may be significant that the ARAF1 oncogene (OMIM Ref. No. 311010) maps to the same region. Inactivation of the normal X chromosome in cells carrying the X/autosome translocation may result in loss of expression of the normal allele and allow expression of the altered gene at the breakpoint on the X chromosome. This phenomenon permitted localization of the gene for Duchenne muscular dystrophy (DMD; 300377) and a number of other autosomal recessive disorders that have been observed in females with X/autosome translocations. Smith et al. (1987) identified the translocation

t(X;18)(p11.2;q11.2) in every cell analyzed from each of 3 synovial sarcomas. Karakousis et al. (1987) found a specific translocation between the X chromosome and chromosome 18 in 6 cases of synovial sarcoma. Wang- Wuu et al. (1987) likewise found t(X;18) in a case of synovial sarcoma. In a 13- year- old Japanese girl, Ueda et al. (1988) found t(X;18) in a synovial sarcoma, together with an insertion of chromosome 11q material into 15q. Knight et al. (1989) noted that the oncogene ARAF1 is not directly involved in the X;18 translocation. Miozzo et al. (1992) reported the instructive case of a patient with the Turner syndrome in whom the only X chromosome was involved in a translocation of typical form: t(X;18)(p11;q11). Knight et al. (1992) examined a hybrid cell line by Southern analysis using 13 additional markers located at Xp11.3- cen. The location of the breakpoint was further confirmed by fluorescence in situ hybridization. Two YAC probes of 300 kb and 450 kb, containing the OATL2 locus (OMIM Ref. No. 311241), hybridized to both derivative chromosomes, indicating that these YACs span the translocation breakpoint. Similar results were obtained with 2 independent cell lines carrying the translocation. Sinke et al. (1993) concluded that the translocation breakpoint in Xp11.2

that is associated with synovial sarcoma is different from the translocation breakpoint in Xp11.2 associated with renal adenocarcinoma (see OMIM Ref. No. 314310). By screening a synovial sarcoma cDNA library with a YAC spanning the X chromosome breakpoint, Clark et al. (1994) identified a hybrid transcript that contained 5-prime sequences (designated OMIM Ref. No. SSXT; 600192) mapping to chromosome 18 and 3- prime sequences (designated SSX by them) mapping to the X chromosome. An SYT probe detected genomic rearrangements in 10 of 13 synovial sarcomas. Sequencing of cDNA clones showed that the normal SYT gene encodes a protein rich in glutamine, proline, and glycine and that in synovial sarcoma, rearrangement of the SYT gene results in the formation of an SYT- SSX fusion protein. Both SYT and SSX failed to exhibit significant homology to known gene sequences.

[9373]

[9374] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9375] Clark, J.; Rocques, P. J.; Crew, A. J.; Gill, S.; Shipley, J.; Chan, A. M.- L.; Gusterson, B. A.; Cooper, C. S. : Identifi-

cation of novel genes, SYT and SSX, involved in the t(X;18)(p11.2;q11.2) translocation found in human synovial sarcoma. Nature Genet. 7: 502- 508, 1994. ; and

[9376] Turc- Carel, C.; Dal Cin, P.; Limon, J.; Rao, U.; Li, F. P.; Corson, J. M.; Zimmerman, R.; Parry, D. M.; Cowan, J. M.; Sandberg, A. A. : Involvement of chromosome X in primary cytogenet.

[9377] Further studies establishing the function and utilities of SSX1 are found in John Hopkins OMIM database record ID 312820, and in cited publications listed in Table 5, which are hereby incorporated by reference.Synovial sarcoma, x breakpoint 8 (SSX8, Accession NP_777621.1) is another GAM63 target gene, herein designated TARGET GENE. SSX8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SSX8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SSX8 BINDING SITE, designated SEQ ID:2767, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9378] Another function of GAM63 is therefore inhibition of Synovial sarcoma, x breakpoint 8 (SSX8, Accession

NP_777621.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSX8.

[9379] ST6GALNAC6 (Accession NP_038471.2) is another GAM63 target gene, herein designated TARGET GENE. ST6GALNAC6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ST6GALNAC6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ST6GALNAC6 BINDING SITE, designated SEQ ID:1576, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9380] Another function of GAM63 is therefore inhibition of ST6GALNAC6 (Accession NP_038471.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST6GALNAC6.

[9381] Sulfotransferase family 4a, member 1 (SULT4A1, Accession NP_795343.1) is another GAM63 target gene, herein designated TARGET GENE. SULT4A1 BINDING SITE is a target binding site found in the 3` untranslated region of

multiple transcripts of mRNA encoded by SULT4A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SULT4A1 BINDING SITE, designated SEQ ID:12034, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9382] Another function of GAM63 is therefore inhibition of Sulfotransferase family 4a, member 1 (SULT4A1, Accession NP_795343.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT4A1.

[9383] Synaptogyrin 1 (SYNGR1, Accession NP_004702.2) is another GAM63 target gene, herein designated TARGET GENE. SYNGR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SYNGR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYNGR1 BINDING SITE, designated SEQ ID:8617, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9384] Another function of GAM63 is therefore inhibition of Synaptogyrin 1 (SYNGR1, Accession NP_004702.2), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1.

[9385] The function of SYNGR1 has been established by previous studies. Rat synaptogyrin, or RATSYNGR1, is an integral membrane protein associated with presynaptic vesicles in neuronal cells. See SYNGR2 (OMIM Ref. No. 603926). As part of an effort to sequence the long arm of human chromosome 22, Kedra et al. (1998) identified the human homolog of RATSYNGR1, synaptogyrin- 1 (OMIM Ref. No. SYNGR1). By a combination of EST database searching and library screening, the authors isolated cDNAs corresponding to 3 alternatively spliced transcripts, which they designated SYNGR1a- c. The predicted 1a, 1b, and 1c proteins contain 234, 191, and 192 amino acids, respectively. Northern blot analysis revealed that the 4.5- kb SYNGR1a mRNA is expressed at high levels in brain. The other transcript forms are expressed at low levels in nonneuronal tissues. In situ hybridization to embryonic and adult

mouse tissues confirmed that SYNGR1a, the most abundant transcript form, shows predominantly neuronal expression. Kedra et al. (1998) also identified cDNAs encoding the related human proteins SYNGR2 and SYNGR3 (OMIM Ref. No. 603927) and mouse Syngr1b. Like RAT-SYNGR1, the mouse and human synaptogyrin family members contain 4 membrane- spanning domains. The conserved central portion of SYNGR1a shares 54%, 61%, and 92% identity with that of SYNGR2, SYNGR3, and RAT-SYNGR1, respectively.

[9386] Animal model experiments lend further support to the function of SYNGR1. Using gene targeting, Janz et al. (1999) generated mice lacking Syngr1. They bred these Syngr1 knockout mice against Syp (OMIM Ref. No. 313475) knockout mice generated by McMahon et al. (1996) to create double knockout mice deficient in both Syp and Syngr1. Both single and double knockout mice were viable and fertile. Morphologic and biochemical analysis showed that the architecture and composition of synapses were unaltered in the brains of Syngr1 single knockout and Syngr1/Syp double knockout mutant mice. Electrophysiologic recordings in the hippocampal CA1 region revealed that short- and long- term synaptic plastic-

ity was severely reduced in the Syngr1/Syp double knock-out mice without changes in the fundamental release apparatus, vesicle cycling, or release probability. Janz et al. (1999) concluded that Syngr1 and Syp perform essential and redundant functions in synaptic plasticity without being required for synaptic transmission as such.

[9387] It is appreciated that the abovementioned animal model for SYNGR1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[9388] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9389] Janz, R.; Sudhof, T. C.; Hammer, R. E.; Unni, V.; Siegelbaum, S. A.; Bolshakov, V. Y. : Essential roles in synaptic plasticity for synaptogyrin I and synaptophysin I. Neuron 24: 687- 700, 1999. ; and

[9390] Kedra, D.; Pan, H.- Q.; Seroussi, E.; Fransson, I.; Guilbaud, C.; Collins, J. E.; Dunham, I.; Blennow, E.; Roe, B. A.; Piehl, F.; Dumanski, J. P. : Characterization of the human synapto.

[9391] Further studies establishing the function and utilities of SYNGR1 are found in John Hopkins OMIM database record

ID 603925, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transforming, acidic coiled-coil containing protein 1 (TACC1, Accession NP_006274.1) is another GAM63 target gene, herein designated TARGET GENE. TACC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TACC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TACC1 BINDING SITE, designated SEQ ID:3381, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9392] Another function of GAM63 is therefore inhibition of Transforming, acidic coiled-coil containing protein 1 (TACC1, Accession NP_006274.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACC1.

[9393] Transcription elongation factor a (sii), 3 (TCEA3, Accession XP_114075.1) is another GAM63 target gene, herein designated TARGET GENE. TCEA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TCEA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCEA3 BINDING SITE, designated SEQ ID:9591, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9394] Another function of GAM63 is therefore inhibition of Transcription elongation factor a (sii), 3 (TCEA3, Accession XP_114075.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCEA3.

[9395] T-cell leukemia translocation altered gene (TCTA, Accession NP_071503.1) is another GAM63 target gene, herein designated TARGET GENE. TCTA BINDING SITE1 and TCTA BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TCTA, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCTA BINDING SITE1 and TCTA BINDING SITE2, designated SEQ ID:9236 and SEQ ID:8960 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9396] Another function of GAM63 is therefore inhibition of T-cell leukemia translocation altered gene (TCTA, Accession

NP_071503.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCTA.

[9397] TEM7 (Accession NP_065138.2) is another GAM63 target gene, herein designated TARGET GENE. TEM7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TEM7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TEM7 BINDING SITE, designated SEQ ID:7488, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9398] Another function of GAM63 is therefore inhibition of TEM7 (Accession NP_065138.2), a gene which involves in angiogenesis and therefore may be associated with Colorectal cancer. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Colorectal cancer, and of other diseases and clinical conditions associated with TEM7.

[9399] The function of TEM7 has been established by previous studies. Using serial analysis of gene expression (SAGE), St Croix et al. (2000) identified partial cDNAs corresponding

to several tumor endothelial markers (TEMs) that displayed elevated expression during tumor angiogenesis. Among the genes they identified was TEM7. Using database searches and 5- prime RACE, Carson- Walter et al. (2001) derived sequences covering the entire TEM7 coding region, which encodes a 500- amino acid type I transmembrane protein containing a plexin- like domain. An alternate transcript of the TEM7 gene had been designated TEM3 by St Croix et al. (2000). TEM3 and TEM7 differ in the use of alternative polyadenylation sites but result in the same predicted protein. The mouse ortholog of TEM7 shares 81% amino acid identity with the human protein. In situ hybridization analysis of human colorectal cancer by Carson- Walter et al. (2001) demonstrated that TEM7 was expressed clearly in the endothelial cells of the tumor stroma but not in the endothelial cells of normal colonic tissue. Using in situ hybridization to assay expression in various normal adult mouse tissues, they observed that Tem7 was largely undetectable in mouse tissues or tumors, but was abundantly expressed in mouse brain. Carson- Walter et al. (2001) localized Tem7 expression to Purkinje cells of the cerebellum and some neuronal cells.

[9400]

[9401] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9402] Carson- Walter, E. B.; Watkins, D. N.; Nanda, A.; Vogelstein, B.; Kinzler, K. W.; St. Croix, B. : Cell surface tumor endothelial markers are conserved in mice and humans. Cancer Res. 61: 6649- 6655, 2001. ; and

[9403] St. Croix, B.; Rago, C.; Velculescu, V.; Traverso, G.; Romans, K. E.; Montgomery, E.; Lal, A.; Riggins, G. J.; Lengauer, C.; Vogelstein, B.; Kinzler, K. W. : Genes expressed in human tu.

[9404] Further studies establishing the function and utilities of TEM7 are found in John Hopkins OMIM database record ID 606826, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_775303.1) is another GAM63 target gene, herein designated TARGET GENE. TGIF BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TGIF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGIF BINDING SITE, desig-

nated SEQ ID:14985, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9405] Another function of GAM63 is therefore inhibition of Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_775303.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF.

[9406] Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_775299.1) is another GAM63 target gene, herein designated TARGET GENE. TGIF BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TGIF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGIF BINDING SITE, designated SEQ ID:14985, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9407] Another function of GAM63 is therefore inhibition of Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_775299.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with TGIF.

[9408] Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_775302.1) is another GAM63 target gene, herein designated TARGET GENE. TGIF BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TGIF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGIF BINDING SITE, designated SEQ ID:14985, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9409] Another function of GAM63 is therefore inhibition of Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_775302.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF.

[9410] Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_775300.1) is another GAM63 target gene, herein designated TARGET GENE. TGIF BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TGIF, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGIF BINDING SITE, designated SEQ ID:14985, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9411] Another function of GAM63 is therefore inhibition of Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_775300.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF.

[9412] Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_733796.2) is another GAM63 target gene, herein designated TARGET GENE. TGIF BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TGIF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGIF BINDING SITE, designated SEQ ID:14985, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9413] Another function of GAM63 is therefore inhibition of Tgfb-induced factor (tale family homeobox) (TGIF, Acces-

sion NP_733796.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF.

[9414] Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_775301.1) is another GAM63 target gene, herein designated TARGET GENE. TGIF BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TGIF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGIF BINDING SITE, designated SEQ ID:14985, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9415] Another function of GAM63 is therefore inhibition of Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_775301.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF.

[9416] Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_003235.1) is another GAM63 target gene, herein designated TARGET GENE. TGIF BINDING SITE is a target binding site found in the 3` untranslated region of multi-

ple transcripts of mRNA encoded by TGIF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGIF BINDING SITE, designated SEQ ID:14985, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9417] Another function of GAM63 is therefore inhibition of Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_003235.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF.

[9418] Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_777480.1) is another GAM63 target gene, herein designated TARGET GENE. TGIF BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TGIF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGIF BINDING SITE, designated SEQ ID:14985, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9419] Another function of GAM63 is therefore inhibition of Tgfb-induced factor (tale family homeobox) (TGIF, Accession NP_777480.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF.

[9420] Thrombopoietin (myeloproliferative leukemia virus oncogene ligand, megakaryocyte growth and development factor) (THPO, Accession NP_000451.1) is another GAM63 target gene, herein designated TARGET GENE. THPO BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by THPO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of THPO BINDING SITE, designated SEQ ID:15986, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9421] Another function of GAM63 is therefore inhibition of Thrombopoietin (myeloproliferative leukemia virus oncogene ligand, megakaryocyte growth and development factor) (THPO, Accession NP_000451.1), a gene which binds to c- Mpl receptor and regulates megakaryocyte development and therefore may be associated with Essential

thrombocythemia. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Essential thrombocythemia, and of other diseases and clinical conditions associated with THPO.

[9422] The function of THPO has been established by previous studies. Bartley et al. (1994) reported the identification and cloning of a megakaryocyte growth and development factor (MGDF) from canine, murine, and human sources. Human, dog, and mouse cDNAs for MGDF are highly conserved and encode open reading frames for proteins of 353, 352, and 356 amino acids, respectively. Both canine and recombinant human MGDF support the development of megakaryocytes from human CD34(+) progenitor cell populations. MGDF binds to Mpl affinity columns, and its biologic effects are inhibited by the soluble extracellular domain of Mpl, suggesting that MGDF is a cytokine that regulates megakaryocyte development and is a ligand for the MPL receptor. Farese et al. (1996) reported that administration of a pegylated form of recombinant MGDF (PEG- MGDF) significantly induced bone marrow regeneration compared with rMGDF untreated with PEG. When combined with recombinant G- CSF, PEG- MGDF significantly enhanced multilineage hematopoietic recovery with

no evidence of lineage competition. Ratajczak et al. (1997) found that in the presence of erythropoietin (OMIM Ref. No. 133170) and interleukin- 3 (OMIM Ref. No. 147740), THPO was able to stimulate a small increase in erythroid colony formation in culture. Other studies suggested that THPO has little direct stimulatory effect on erythroid progenitor cells but may indirectly enhance erythropoiesis by preventing very early erythroid progenitor cells from undergoing apoptotic cell death. Essential thrombocythemia (OMIM Ref. No. 187950) is a chronic myeloproliferative syndrome due to sustained proliferation of megakaryocytes, which results in elevated numbers of circulating platelets, thrombotic or hemorrhagic episodes, and occasional leukemic transformation. Hereditary thrombocythemia with autosomal dominant transmission has been described with manifestations similar to those of sporadic essential thrombocythemia. As the THPO gene encodes a lineage- restricted growth factor with profound stimulatory effects on megakaryopoiesis and platelet production, Wiestner et al. (1998) tested the hypothesis that mutation in this gene might be responsible for the disorder in a Dutch family with 11 affected individuals. TPO protein concentrations in serum were consistently elevated in af-

fected members of this family. Using an intragenic CA marker for the THPO gene, they demonstrated linkage to the disorder; lod score = 3.5 at theta = 0.0. Affected members were found to carry a splice donor mutation (600044.0001) that led to THPO mRNAs with shortened 5- prime untranslated regions that were more efficiently translated than the normal THPO transcripts.

[9423]

[9424] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9425] Bartley, T. D.; Bogenberger, J.; Hunt, P.; Li, Y.- S.; Lu, H. S.; Martin, F.; Chang, M.- S.; Samal, B.; Nichol, J. L.; Swift, S.; Johnson, M. J.; Hsu, R.- Y.; and 41 others : Identification and cloning of a megakaryocyte growth and development factor that is a ligand for the cytokine receptor Mpl. Cell 77: 1117- 1124, 1994. ; and

[9426] Wiestner, A.; Schlemper, R. J.; van der Maas, A. P. C.; Skoda, R. C. : An activating splice donor mutation in the thrombopoietin gene causes hereditary thrombo- cythaemia. Nature Genet.

[9427] Further studies establishing the function and utilities of THPO are found in John Hopkins OMIM database record ID

600044, and in cited publications listed in Table 5, which are hereby incorporated by reference.Translocase of inner mitochondrial membrane 9 homolog (yeast) (TIMM9, Accession NP_036592.1) is another GAM63 target gene, herein designated TARGET GENE. TIMM9 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TIMM9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TIMM9 BINDING SITE, designated SEQ ID:8618, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9428] Another function of GAM63 is therefore inhibition of Translocase of inner mitochondrial membrane 9 homolog (yeast) (TIMM9, Accession NP_036592.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMM9.

[9429] TIP-1 (Accession NP_055419.1) is another GAM63 target gene, herein designated TARGET GENE. TIP-1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TIP-1, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TIP-1 BINDING SITE, designated SEQ ID:10187, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9430] Another function of GAM63 is therefore inhibition of TIP-1 (Accession NP_055419.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIP-1.

[9431] Triple homeobox 1 (TIX1, Accession NP_055850.1) is another GAM63 target gene, herein designated TARGET GENE. TIX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TIX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TIX1 BINDING SITE, designated SEQ ID:4786, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9432] Another function of GAM63 is therefore inhibition of Triple homeobox 1 (TIX1, Accession NP_055850.1) . Accordingly, utilities of GAM63 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with TIX1.

[9433] Tropomodulin 2 (neuronal) (TMOD2, Accession NP_055363.1) is another GAM63 target gene, herein designated TARGET GENE. TMOD2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TMOD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TMOD2 BINDING SITE, designated SEQ ID:5911, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9434] Another function of GAM63 is therefore inhibition of Tropomodulin 2 (neuronal) (TMOD2, Accession NP_055363.1), a gene which is an actin- capping protein for the slow- growing end of filamentous actin. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMOD2.

[9435] The function of TMOD2 has been established by previous studies. Watakabe et al. (1996) identified and purified rat NTMOD as a protein that binds to the neuron- specific

tropomyosin isoform, Tmbr3. Using degenerate oligonucleotides based on peptide sequences of NTMOD, they cloned an NTMOD cDNA from a rat brain cDNA library. Northern blot and RNase protection analyses detected NTMOD mRNA expression predominantly in brain. Immunofluorescence of primary frontal cortex cell cultures showed that NTMOD is specifically expressed in neurons. By screening a human cerebellar cDNA library with a portion of the rat NTMOD as probe, Cox and Zoghbi (2000) cloned a human NTMOD cDNA, designated TMOD2. TMOD2 encodes a deduced 351- amino acid protein. Northern blot analysis demonstrated restricted expression of TMOD2 in neuronal tissues; an approximately 9.5- kb transcript was seen in all brain regions. Cox and Zoghbi (2000) also cloned the mouse ortholog. Northern blot analysis showed that expression of mouse Tmod2 occurred as early as embryonic day 7 and progressively increased during development.

[9436]

[9437] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9438] Watakabe, A.; Kobayashi, R.; Helfman, D. M. : N- tropo-

modulin: a novel isoform of tropomodulin identified as the major binding protein to brain tropomyosin. J. Cell Sci. 109: 2299- 2310, 1996. ; and

[9439] Cox, P. R.; Zoghbi, H. Y. : Sequencing, expression analysis, and mapping of three unique human tropomodulin genes and their mouse orthologs. Genomics 63: 97- 107, 2000.

[9440] Further studies establishing the function and utilities of TMOD2 are found in John Hopkins OMIM database record ID 602928, and in cited publications listed in Table 5, which are hereby incorporated by reference.TMSNB (Accession NP_068832.1) is another GAM63 target gene, herein designated TARGET GENE. TMSNB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TMSNB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TMSNB BINDING SITE, designated SEQ ID:6359, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9441] Another function of GAM63 is therefore inhibition of TMSNB (Accession NP_068832.1) . Accordingly, utilities of

GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMSNB.

[9442] Tumor necrosis factor receptor superfamily, member 10b (TNFRSF10B, Accession NP_671716.1) is another GAM63 target gene, herein designated TARGET GENE. TNFRSF10B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNFRSF10B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:1812, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9443] Another function of GAM63 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 10b (TNFRSF10B, Accession NP_671716.1), a gene which forms complex that induces apoptosis. and therefore may be associated with Squamous cell carcinoma . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Squamous cell carcinoma ., and of other diseases and clinical conditions associated with TNFRSF10B.

[9444] The function of TNFRSF10B and its association with vari-

ous diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Tumor necrosis factor receptor superfamily, member 10b (TNFRSF10B, Accession NP_003833.3) is another GAM63 target gene, herein designated TARGET GENE. TNFRSF10B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNFRSF10B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:1812, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9445] Another function of GAM63 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 10b (TNFRSF10B, Accession NP_003833.3), a gene which forms complex that induces apoptosis. and therefore may be associated with Squamous cell carcinoma . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Squamous cell carcinoma ., and of other diseases and clinical conditions associated with TNFRSF10B.

[9446] The function of TNFRSF10B and its association with vari-

ous diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Tumor necrosis factor receptor superfamily, member 8 (TNFRSF8, Accession NP_001234.1) is another GAM63 target gene, herein designated TARGET GENE. TNFRSF8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNFRSF8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFRSF8 BINDING SITE, designated SEQ ID:10652, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9447] Another function of GAM63 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 8 (TNFRSF8, Accession NP_001234.1), a gene which regulates gene expression through activation of nf- kappab. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF8.

[9448] The function of TNFRSF8 has been established by previous studies. By in vitro binding, immunoprecipitation, im-

munoblot, and yeast 2- hybrid analyses, Aizawa et al. (1997) showed that TRAF2 (OMIM Ref. No. 601895) and TRAF5 (OMIM Ref. No. 602356) interact with overlapping but distinct sequences in the C- terminal region of CD30 and mediate the activation of nuclear factor kappa- B (see OMIM Ref. No. 164011). Kurts et al. (1999) identified a new mechanism that protects against autoimmunity mediated through CD30. CD30 is expressed by activated, but not by resting, B or T cells. Using a model system in which ovalbumin- specific CD8+ T cells from the OT- I transgenic line were adoptively transferred into unirradiated transgenic mice that expressed ovalbumin in the pancreatic beta cells and the proximal renal tubular cells, Kurts et al. (1999) found that wildtype OT- I cells caused diabetes only when adoptively transferred in large numbers (greater than 250,000), with lower doses being effectively tolerized. CD30- deficient islet- specific CD8+ T cells were roughly 6,000- fold more autoaggressive than wildtype cells, with the transfer of as few as 160 CD30- deficient T cells leading to the complete destruction of pancreatic islets and the rapid onset of diabetes (within 4 days). Kurts et al. (1999) showed that in the absence of CD30 signaling, cells activated but not yet deleted by the

CD95 (OMIM Ref. No. 134637)- dependent cross- tolerance mechanism gain the ability to proliferate extensively upon secondary encounter with antigen on parenchymal tissues, such as the pancreatic islets. Thus, CD30 signaling limits the proliferative potential of autoreactive CD8 effector T cells, and protects the body against autoimmunity.

[9449]

[9450] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9451] Aizawa, S.; Nakano, H.; Ishida, T.; Horie, R.; Nagai, M.; Ito, K.; Yagita, H.; Okumura, K.; Inoue, J.; Watanabe, T. : Tumor necrosis factor receptor- associated factor (TRAF) 5 and TRAF2 are involved in CD30- mediated NF- kappa- B activation. J. Biol. Chem. 272: 2042- 2045, 1997. ; and

[9452] Kurts, C.; Carbone, F. R.; Krummel, M. F.; Koch, K. M.; Miller, J. F. A. P.; Heath, W. R. : Signalling through CD30 protects against autoimmune diabetes mediated by CD8 T cells. Nature 3.

[9453] Further studies establishing the function and utilities of TNFRSF8 are found in John Hopkins OMIM database record ID 153243, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Tumor necrosis factor receptor superfamily, member 8 (TNFRSF8, Accession NP_694421.1) is another GAM63 target gene, herein designated TARGET GENE. TNFRSF8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNFRSF8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFRSF8 BINDING SITE, designated SEQ ID:10652, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9454] Another function of GAM63 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 8 (TNFRSF8, Accession NP_694421.1), a gene which regulates gene expression through activation of nf- kappab. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF8.

[9455] The function of TNFRSF8 has been established by previous studies. By in vitro binding, immunoprecipitation, immunoblot, and yeast 2- hybrid analyses, Aizawa et al. (1997) showed that TRAF2 (OMIM Ref. No. 601895) and

TRAF5 (OMIM Ref. No. 602356) interact with overlapping but distinct sequences in the C- terminal region of CD30 and mediate the activation of nuclear factor kappa- B (see OMIM Ref. No. 164011). Kurts et al. (1999) identified a new mechanism that protects against autoimmunity mediated through CD30. CD30 is expressed by activated, but not by resting, B or T cells. Using a model system in which ovalbumin- specific CD8+ T cells from the OT- I transgenic line were adoptively transferred into unirradiated transgenic mice that expressed ovalbumin in the pancreatic beta cells and the proximal renal tubular cells, Kurts et al. (1999) found that wildtype OT- I cells caused diabetes only when adoptively transferred in large numbers (greater than 250,000), with lower doses being effectively tolerized. CD30- deficient islet- specific CD8+ T cells were roughly 6,000- fold more autoaggressive than wildtype cells, with the transfer of as few as 160 CD30- deficient T cells leading to the complete destruction of pancreatic islets and the rapid onset of diabetes (within 4 days). Kurts et al. (1999) showed that in the absence of CD30 signaling, cells activated but not yet deleted by the CD95 (OMIM Ref. No. 134637)- dependent cross- tolerance mechanism gain the ability to proliferate extensively

upon secondary encounter with antigen on parenchymal tissues, such as the pancreatic islets. Thus, CD30 signaling limits the proliferative potential of autoreactive CD8 effector T cells, and protects the body against autoimmunity.

[9456]

[9457] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9458] Aizawa, S.; Nakano, H.; Ishida, T.; Horie, R.; Nagai, M.; Ito, K.; Yagita, H.; Okumura, K.; Inoue, J.; Watanabe, T. : Tumor necrosis factor receptor- associated factor (TRAF) 5 and TRAF2 are involved in CD30- mediated NF- kappa- B activation. J. Biol. Chem. 272: 2042- 2045, 1997. ; and

[9459] Kurts, C.; Carbone, F. R.; Krummel, M. F.; Koch, K. M.; Miller, J. F. A. P.; Heath, W. R. : Signalling through CD30 protects against autoimmune diabetes mediated by CD8 T cells. Nature 3.

[9460] Further studies establishing the function and utilities of TNFRSF8 are found in John Hopkins OMIM database record ID 153243, and in cited publications listed in Table 5, which are hereby incorporated by reference.Trinucleotide repeat containing 4 (TNRC4, Accession NP_009116.2) is

another GAM63 target gene, herein designated TARGET GENE. TNRC4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TNRC4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNRC4 BINDING SITE, designated SEQ ID:4212, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9461] Another function of GAM63 is therefore inhibition of Trinucleotide repeat containing 4 (TNRC4, Accession NP_009116.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC4.

[9462] TOPBP1 (Accession NP_008958.1) is another GAM63 target gene, herein designated TARGET GENE. TOPBP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TOPBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TOPBP1 BINDING SITE, designated SEQ ID:19773, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA,

also designated SEQ ID:348.

[9463] Another function of GAM63 is therefore inhibition of TOPBP1 (Accession NP_008958.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOPBP1.

[9464] TOSO (Accession NP_005440.1) is another GAM63 target gene, herein designated TARGET GENE. TOSO BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TOSO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TOSO BINDING SITE, designated SEQ ID:18553, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9465] Another function of GAM63 is therefore inhibition of TOSO (Accession NP_005440.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOSO.

[9466] TP53I11 (Accession NP_006025.1) is another GAM63 target gene, herein designated TARGET GENE. TP53I11 BINDING SITE1 and TP53I11 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts

of mRNA encoded by TP53I11, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TP53I11 BINDING SITE1 and TP53I11 BINDING SITE2, designated SEQ ID:945 and SEQ ID:2826 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9467] Another function of GAM63 is therefore inhibition of TP53I11 (Accession NP_006025.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53I11.

[9468] Testis specific protein 1 (probe h4-1 p3-1) (TPX1, Accession NP_003287.1) is another GAM63 target gene, herein designated TARGET GENE. TPX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TPX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TPX1 BINDING SITE, designated SEQ ID:10561, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9469] Another function of GAM63 is therefore inhibition of

Testis specific protein 1 (probe h4-1 p3-1) (TPX1, Accession NP_003287.1), a gene which Testis specific protein 1; member of the cysteine- rich secretory protein (CRISP) family. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPX1.

[9470] The function of TPX1 has been established by previous studies. In the course of characterizing a large number of genomic clones isolated from mouse chromosome 17, Kasahara et al. (1987) found a cosmid clone containing a sequence transcribed specifically in the testis. Subsequent studies (Kasahara et al., 1989) demonstrated a map location between Pgk2 and Mep1 on mouse chromosome 17, making it unlikely that the gene is involved in t mutant phenotypes. Kasahara et al. (1989) described the cDNA sequences of the mouse gene, named Tpx1, and of its human counterpart TPX1. The 2 showed 77.8% nucleotide and 70% amino acid sequence similarity. The mouse gene showed 64.2% nucleotide and 55.1% amino acid sequence similarity to that of a rat sperm- coding glycoprotein gene, the protein product of which is secreted by the epidermis. By Southern blot analysis of somatic cell hybrid DNA, Kasahara et al. (1989) mapped the human TPX1

gene to 6p21- qter.

[9471]

[9472] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9473] Kasahara, M.; Figueroa, F.; Klein, J. : Random cloning of genes from mouse chromosome 17. Proc. Nat. Acad. Sci. 84: 3325- 3328, 1987. ; and

[9474] Kasahara, M.; Gutknecht, J.; Brew, K.; Spurr, N.; Goodfellow, P. N. : Cloning and mapping of a testis- specific gene with sequence similarity to a sperm- coating glycoprotein gene. Genomic.

[9475] Further studies establishing the function and utilities of TPX1 are found in John Hopkins OMIM database record ID 187430, and in cited publications listed in Table 5, which are hereby incorporated by reference.TRIP-Br2 (Accession NP_055570.1) is another GAM63 target gene, herein designated TARGET GENE. TRIP-Br2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRIP-Br2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, des-

ignated SEQ ID:14867, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9476] Another function of GAM63 is therefore inhibition of TRIP-Br2 (Accession NP_055570.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2.

[9477] Transient receptor potential cation channel, subfamily c, member 6 (TRPC6, Accession NP_004612.2) is another GAM63 target gene, herein designated TARGET GENE. TRPC6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRPC6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRPC6 BINDING SITE, designated SEQ ID:20179, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9478] Another function of GAM63 is therefore inhibition of Transient receptor potential cation channel, subfamily c, member 6 (TRPC6, Accession NP_004612.2), a gene which has calcium channel activity. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with TRPC6.

[9479] The function of TRPC6 has been established by previous studies. TRPCs, mammalian homologs of the Drosophila transient receptor potential (trp) protein, are ion channels that are thought to mediate capacitative calcium entry into the cell. Using a PCR- based strategy, Hofmann et al. (1999) isolated cDNAs encoding TRPC6, a novel member of the TRPC family. The predicted 931- amino acid protein shares 93% identity with mouse Trpc6. The authors found that TRPC6 is a nonselective cation channel that is activated by diacylglycerol (DAG) in a membrane- delimited fashion, independently of protein kinase C. Although TRPC3 (OMIM Ref. No. 602345), the closest structural relative of TRPC6, is activated in the same manner, human TRPC1 and mouse Trpc4 (OMIM Ref. No. 603651) and Trpc5 (OMIM Ref. No. 300334) were unresponsive to DAG. The authors suggested that TRPC3 and TRPC6 represent the first members of a new functional family of second-messenger- operated cation channels that are activated by DAG. Northern blot analysis revealed that TRPC6 is expressed primarily in placenta, lung, spleen, ovary, and small intestine. By FISH, D'Esposito et al. (1998) mapped the TRPC6 gene to chromosome 11q21- q22.

[9480]

[9481] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9482] Hofmann, T.; Obukhov, A. G.; Schaefer, M.; Harteneck, C.; Gudermann, T.; Schultz, G. : Direct activation of human TRPC6 and TRPC3 channels by diacylglycerol. Nature 397: 259- 263, 1999. ; and

[9483] D'Esposito, M.; Strazzullo, M.; Cuccurese, M.; Spalluto, C.; Rocchi, M.; D'Urso, M.; Ciccodicola, A. : Identification and assignment of the human transient receptor potential channel 6 gene.

[9484] Further studies establishing the function and utilities of TRPC6 are found in John Hopkins OMIM database record ID 603652, and in cited publications listed in Table 5, which are hereby incorporated by reference.U5-116KD (Accession NP_004238.1) is another GAM63 target gene, herein designated TARGET GENE. U5-116KD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by U5-116KD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of U5-116KD

BINDING SITE, designated SEQ ID:4615, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9485] Another function of GAM63 is therefore inhibition of U5-116KD (Accession NP_004238.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with U5-116KD.

[9486] Ubiquitin-conjugating enzyme e2 variant 1 (UBE2V1, Accession NP_071887.1) is another GAM63 target gene, herein designated TARGET GENE. UBE2V1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UBE2V1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE, designated SEQ ID:17471, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9487] Another function of GAM63 is therefore inhibition of Ubiquitin-conjugating enzyme e2 variant 1 (UBE2V1, Accession NP_071887.1), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of GAM63

include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1.

[9488] The function of UBE2V1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Unc-119 homolog (c. elegans) (UNC119, Accession NP_473376.1) is another GAM63 target gene, herein designated TARGET GENE. UNC119 BINDING SITE1 and UNC119 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by UNC119, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UNC119 BINDING SITE1 and UNC119 BINDING SITE2, designated SEQ ID:4264 and SEQ ID:3155 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9489] Another function of GAM63 is therefore inhibition of Unc-119 homolog (c. elegans) (UNC119, Accession NP_473376.1), a gene which is expressed in the retina and may play a role in the mechanism of photoreceptor neurotransmitter release through the synaptic vesicle cy-

cle. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC119.

[9490] The function of UNC119 has been established by previous studies. Using a subtractive hybridization strategy, Higashide et al. (1996) identified a retina- specific cDNA that they designated HRG4 (human retinal gene- 4). Northern blot analysis revealed that the approximately 1.4- kb HRG4 mRNA is expressed specifically in human retina. The authors also cloned a cDNA encoding RRG4, the rat HRG4 homolog. The predicted 240- amino acid human and rat proteins both contain an N- terminal region rich in proline and glycine followed by a region with a mixture of alpha helices, beta sheets, and turns. Sequence comparisons indicated that the proline- glycine domains of RRG4 and HRG4 share only 67% homology, while the rest of the sequence is 100% identical. By in situ hybridization, Higashide et al. (1996) demonstrated that the HRG4 gene is expressed specifically in photoreceptors, both rods and cones, in human retina. In rat, the authors observed high levels of RRG4 expression in the outer retina beginning around postnatal day 5, when the photoreceptors begin to differentiate, and expression in-

creased rapidly to reach the adult level by postnatal day 23. Mutations in the C. elegans unc119 gene lead to defects in locomotion, feeding behavior, and chemosensation. Both Swanson et al. (1998) and Higashide et al. (1998) observed that HRG4 shares strong homology with the C. elegans unc119 protein, leading Swanson et al. (1998) to designate the human protein UNC119. Swanson et al. (1998) stated that a human UNC119 cDNA functionally complemented the C. elegans unc119 mutation. Using immunofluorescence, Higashide et al. (1998) localized HRG4 to the outer plexiform layer of the retina in the synaptic termini of rod and cone photoreceptors. Electron microscopic immunolocalization showed that the protein is present in the cytoplasm and on the presynaptic membranes of the photoreceptor synapses. The authors suggested that HRG4 may play a role in the mechanism of photoreceptor neurotransmitter release through the synaptic vesicle cycle. They noted that the homology of HRG4 and unc119 is consistent with a possible role of HRG4 in the synaptic vesicle cycle, because the broad effects of unc119 on neuronal function are consistent with a defect in neurotransmission.

[9491]

[9492] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9493] Higashide, T.; Murakami, A.; McLaren, M. J.; Inana, G. : Cloning of the cDNA for a novel photoreceptor protein. J. Biol. Chem. 271: 1797- 1804, 1996. ; and

[9494] Swanson, D. A.; Chang, J. T.; Campochiaro, P. A.; Zack, D. J.; Valle, D. : Mammalian orthologs of C. elegans unc- 119 highly expressed in photoreceptors. Invest. Ophthal. Vis. Sci. 39: 20.

[9495] Further studies establishing the function and utilities of UNC119 are found in John Hopkins OMIM database record ID 604011, and in cited publications listed in Table 5, which are hereby incorporated by reference.Unc-119 homolog (c. elegans) (UNC119, Accession NP_473376.1) is another GAM63 target gene, herein designated TARGET GENE. UNC119 BINDING SITE1 and UNC119 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by UNC119, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UNC119 BINDING SITE1 and UNC119 BINDING SITE2, des-

ignated SEQ ID:3155 and SEQ ID:4050 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9496] Another function of GAM63 is therefore inhibition of Unc-119 homolog (c. elegans) (UNC119, Accession NP_473376.1), a gene which is expressed in the retina and may play a role in the mechanism of photoreceptor neurotransmitter release through the synaptic vesicle cycle. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC119.

[9497] The function of UNC119 has been established by previous studies. Using a subtractive hybridization strategy, Higashide et al. (1996) identified a retina- specific cDNA that they designated HRG4 (human retinal gene- 4). Northern blot analysis revealed that the approximately 1.4- kb HRG4 mRNA is expressed specifically in human retina. The authors also cloned a cDNA encoding RRG4, the rat HRG4 homolog. The predicted 240- amino acid human and rat proteins both contain an N- terminal region rich in proline and glycine followed by a region with a mixture of alpha helices, beta sheets, and turns. Sequence comparisons indicated that the proline- glycine

domains of RRG4 and HRG4 share only 67% homology, while the rest of the sequence is 100% identical. By in situ hybridization, Higashide et al. (1996) demonstrated that the HRG4 gene is expressed specifically in photoreceptors, both rods and cones, in human retina. In rat, the authors observed high levels of RRG4 expression in the outer retina beginning around postnatal day 5, when the photoreceptors begin to differentiate, and expression increased rapidly to reach the adult level by postnatal day 23. Mutations in the C. elegans unc119 gene lead to defects in locomotion, feeding behavior, and chemosensation. Both Swanson et al. (1998) and Higashide et al. (1998) observed that HRG4 shares strong homology with the C. elegans unc119 protein, leading Swanson et al. (1998) to designate the human protein UNC119. Swanson et al. (1998) stated that a human UNC119 cDNA functionally complemented the C. elegans unc119 mutation. Using immunofluorescence, Higashide et al. (1998) localized HRG4 to the outer plexiform layer of the retina in the synaptic termini of rod and cone photoreceptors. Electron microscopic immunolocalization showed that the protein is present in the cytoplasm and on the presynaptic membranes of the photoreceptor synapses. The authors sug-

gested that HRG4 may play a role in the mechanism of photoreceptor neurotransmitter release through the synaptic vesicle cycle. They noted that the homology of HRG4 and unc119 is consistent with a possible role of HRG4 in the synaptic vesicle cycle, because the broad effects of unc119 on neuronal function are consistent with a defect in neurotransmission.

[9498]

[9499] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9500] Higashide, T.; Murakami, A.; McLaren, M. J.; Inana, G. : Cloning of the cDNA for a novel photoreceptor protein. J. Biol. Chem. 271: 1797- 1804, 1996. ; and

[9501] Swanson, D. A.; Chang, J. T.; Campochiaro, P. A.; Zack, D. J.; Valle, D. : Mammalian orthologs of C. elegans unc- 119 highly expressed in photoreceptors. Invest. Ophthal. Vis. Sci. 39: 20.

[9502] Further studies establishing the function and utilities of UNC119 are found in John Hopkins OMIM database record ID 604011, and in cited publications listed in Table 5, which are hereby incorporated by reference.Uv radiation resistance associated gene (UVRAG, Accession

NP_003360.2) is another GAM63 target gene, herein designated TARGET GENE. UVRAG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UVRAG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UVRAG BINDING SITE, designated SEQ ID:11078, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9503] Another function of GAM63 is therefore inhibition of Uv radiation resistance associated gene (UVRAG, Accession NP_003360.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UVRAG.

[9504] Vitamin d (1,25- dihydroxyvitamin d3) receptor (VDR, Accession NP_000367.1) is another GAM63 target gene, herein designated TARGET GENE. VDR BINDING SITE1 and VDR BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by VDR, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VDR BINDING SITE1 and VDR BINDING SITE2, designated SEQ

ID:637 and SEQ ID:4294 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9505] Another function of GAM63 is therefore inhibition of Vitamin d (1,25- dihydroxyvitamin d3) receptor (VDR, Accession NP_000367.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDR.

[9506] VTS58635 (Accession NP_201572.1) is another GAM63 target gene, herein designated TARGET GENE. VTS58635 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VTS58635, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VTS58635 BINDING SITE, designated SEQ ID:9459, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9507] Another function of GAM63 is therefore inhibition of VTS58635 (Accession NP_201572.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VTS58635.

[9508] Williams-beuren syndrome chromosome region 17 (WBSCR17, Accession NP_071924.1) is another GAM63 target gene, herein designated TARGET GENE. WBSCR17 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WBSCR17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WBSCR17 BINDING SITE, designated SEQ ID:3611, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9509] Another function of GAM63 is therefore inhibition of Williams-beuren syndrome chromosome region 17 (WBSCR17, Accession NP_071924.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR17.

[9510] ZFP385 (Accession NP_056296.1) is another GAM63 target gene, herein designated TARGET GENE. ZFP385 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZFP385, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFP385 BIND-

ING SITE, designated SEQ ID:16862, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9511] Another function of GAM63 is therefore inhibition of ZFP385 (Accession NP_056296.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP385.

[9512] zizimin1 (Accession NP_056111.1) is another GAM63 target gene, herein designated TARGET GENE. zizimin1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by zizimin1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of zizimin1 BINDING SITE, designated SEQ ID:4665, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9513] Another function of GAM63 is therefore inhibition of zizimin1 (Accession NP_056111.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with zizimin1.

[9514] Zinc finger protein 175 (ZNF175, Accession NP_009078.1) is another GAM63 target gene, herein designated TARGET

GENE. ZNF175 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF175, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF175 BINDING SITE, designated SEQ ID:17154, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9515] Another function of GAM63 is therefore inhibition of Zinc finger protein 175 (ZNF175, Accession NP_009078.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF175.

[9516] Zinc finger protein 179 (ZNF179, Accession NP_009079.1) is another GAM63 target gene, herein designated TARGET GENE. ZNF179 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF179, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF179 BINDING SITE, designated SEQ ID:3345, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9517] Another function of GAM63 is therefore inhibition of Zinc finger protein 179 (ZNF179, Accession NP_009079.1), a gene which has zink finger and a member of the RING finger protein family of transcription factors. and therefore may be associated with Smith- magenis syndrome. Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of Smith- magenis syndrome, and of other diseases and clinical conditions associated with ZNF179.

[9518] The function of ZNF179 has been established by previous studies. Kimura et al. (1997) showed, by FISH analysis of metaphase or interphase chromosomes of 6 patients with Smith- Magenis syndrome (SMS; 182290), that ZNF179 was deleted in one of the homologs, indicating possible involvement of this gene in the pathogenesis of SMS. ZNF179 was sublocalized to a site proximal to LLGL (OMIM Ref. No. 600966), which is thought to be critical to SMS

[9519]

[9520] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9521] Kimura, T.; Arakawa, Y.; Inoue, S.; Fukushima, Y.; Kondo, I.; Koyama, K.; Hosoi, T.; Orimo, A.; Muramatsu, M.; Naka-

mura, Y.; Abe, T.; Inazawa, J. : The brain finger protein gene (ZNF179), a member of the RING finger family, maps within the Smith- Magenis syndrome region at 17p11.2. Am. J. Med. Genet. 69: 320- 324, 1997. ; and

[9522] Matsuda, Y.; Inue, S.; Seki, N.; Hosoi, T.; Orimo, A.; Muramatsu, M.; Hori, T. : Chromosome mapping of human (ZNF179), mouse, and rat genes for brain finger protein (bfp), a member of the R.

[9523] Further studies establishing the function and utilities of ZNF179 are found in John Hopkins OMIM database record ID 601237, and in cited publications listed in Table 5, which are hereby incorporated by reference.Zinc finger protein 261 (ZNF261, Accession NP_005087.1) is another GAM63 target gene, herein designated TARGET GENE. ZNF261 BINDING SITE1 and ZNF261 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ZNF261, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF261 BINDING SITE1 and ZNF261 BINDING SITE2, designated SEQ ID:10852 and SEQ ID:12406 respectively, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated

SEQ ID:348.

[9524] Another function of GAM63 is therefore inhibition of Zinc finger protein 261 (ZNF261, Accession NP_005087.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF261.

[9525] Zinc finger protein 272 (ZNF272, Accession XP_030227.3) is another GAM63 target gene, herein designated TARGET GENE. ZNF272 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF272, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF272 BINDING SITE, designated SEQ ID:9716, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9526] Another function of GAM63 is therefore inhibition of Zinc finger protein 272 (ZNF272, Accession XP_030227.3) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF272.

[9527] Zinc finger protein 323 (ZNF323, Accession NP_112161.2) is another GAM63 target gene, herein designated TARGET

GENE. ZNF323 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF323, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF323 BINDING SITE, designated SEQ ID:13326, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9528] Another function of GAM63 is therefore inhibition of Zinc finger protein 323 (ZNF323, Accession NP_112161.2) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF323.

[9529] ZNF435 (Accession NP_079507.1) is another GAM63 target gene, herein designated TARGET GENE. ZNF435 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF435, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF435 BINDING SITE, designated SEQ ID:19017, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9530] Another function of GAM63 is therefore inhibition of ZNF435 (Accession NP_079507.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF435.

[9531] ZNF436 (Accession NP_085137.1) is another GAM63 target gene, herein designated TARGET GENE. ZNF436 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF436, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF436 BINDING SITE, designated SEQ ID:18528, to the nucleotide sequence of GAM63 RNA, herein designated GAM RNA, also designated SEQ ID:348.

[9532] Another function of GAM63 is therefore inhibition of ZNF436 (Accession NP_085137.1) . Accordingly, utilities of GAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF436.

[9533]

[9534] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 64 (GAM64), which modulates expression of respective target

genes thereof, the function and utility of which target genes is known in the art.

[9535] GAM64 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM64 was detected is described hereinabove with reference to Figs. 8-15.

[9536] GAM64 gene, herein designated GAM GENE, and GAM64 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[9537] GAM64 gene encodes a GAM64 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM64 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM64 precursor RNA is designated SEQ ID:85, and is provided hereinbelow with reference to the sequence listing part.

[9538] GAM64 precursor RNA folds onto itself, forming GAM64 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9539] GAM64 precursor RNA folds onto itself, forming GAM64 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[9540] Nucleotide sequence of GAM64 precursor RNA, designated SEQ-ID: 85, and a schematic representation of a predicted secondary folding of GAM64 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[9541] An enzyme complex designated DICER COMPLEX, `dices` the GAM64 folded precursor RNA into GAM64 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising

an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM64 RNA is designated SEQ ID:239, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[9542] GAM64 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM64 target RNA, herein designated GAM TARGET RNA. GAM64 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9543] GAM64 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM64 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM64 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated

that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM64 RNA may have a different number of target binding sites in untranslated regions of a GAM64 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9544] The complementary binding of GAM64 RNA, herein designated GAM RNA, to target binding sites on GAM64 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM64 target RNA into GAM64 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9545] It is appreciated that GAM64 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM64 target genes. The mRNA of each one of this plurality of GAM64 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM64 RNA, herein designated GAM RNA, and which when bound by

GAM64 RNA causes inhibition of translation of respective one or more GAM64 target proteins.

[9546] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM64 gene, herein designated GAM GENE, on one or more GAM64 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9547] It is appreciated that specific functions and accordingly utilities of GAM64 correlate with, and may be deduced from, the identity of the target genes which GAM64 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9548]

[9549]

[9550] Bagpipe homeobox homolog 1 (drosophila) (BAPX1, Accession NM_001189.2) is a GAM64 target gene, herein designated TARGET GENE. BAPX1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BAPX1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BAPX1 BINDING SITE, designated SEQ ID:11199, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9551] A function of GAM64 is therefore inhibition of Bagpipe homeobox homolog 1 (drosophila) (BAPX1, Accession NM_001189.2), a gene which regulates gene expression, morphogenesis, and differentiation and therefore may be associated with Ellis- van creveld syndrome. Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of Ellis- van creveld syndrome, and of other diseases and clinical conditions associated with BAPX1.

[9552] The function of BAPX1 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM63.1.Dihydrofolate reductase (DHFR, Accession NM_000791.2) is another GAM64 target gene, herein designated TARGET GENE. DHFR BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DHFR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DHFR BINDING SITE, designated SEQ ID:3874, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9553] Another function of GAM64 is therefore inhibition of Dihydrofolate reductase (DHFR, Accession NM_000791.2), a gene which converts dihydrofolate into tetrahydrofolate. Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHFR.

[9554] The function of DHFR has been established by previous studies. Dihydrofolate reductase (EC 1.5.1.3) converts dihydrofolate into tetrahydrofolate, a methyl group shuttle required for the de novo synthesis of purines, thymidylic acid, and certain amino acids. DHFR is inhibited by methotrexate (MTX), a folate analog used as an antineo-

plastic and immunosuppressive agent. From comparisons of eukaryotic gene sequences and protein sequences of homologous enzymes from bacterial and mammalian organisms, Craik et al. (1983) noted that intron- exon junctions often coincide with variable surface loops of the protein structure. Proteins studied included DHFR, trypsin, and chymotrypsin. They pointed out that altered surface structures can account for functional differences among the members of a family, e.g., the serine proteases. 'Sliding' of the intron- exon junctions may constitute a mechanism for generating length polymorphisms and divergent sequences. Different function can thus be achieved without disrupting the stability of the protein core. DNA sequence amplification is one of the most frequent manifestations of genomic instability in human tumors. In most human tumor cells, amplified DNA sequences are borne on unstable, extrachromosomal double minutes (DMs). Singer et al. (2000) isolated a large number of independent methotrexate- resistant human cell lines, all of which contained DHFR- bearing DMs. All but one of these also had suffered partial or complete loss of one of the parental DHFR- bearing chromosomes. Cells in a few populations displayed what could be transient intermediates

in the amplification process, including an initial homogeneously staining chromosome region (HSR), its subsequent breakage, the appearance of DHFR- containing fragments, and, finally, DMs. The studies suggested that both HSRs and DMs are initiated by chromosome breaks, but that cell types differ in how the extra sequences ultimately are processed and/or maintained.

[9555]

[9556] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9557] Singer, M. J.; Mesner, L. D.; Friedman, C. L.; Trask, B. J.; Hamlin, J. L. : Amplification of the human dihydrofolate reductase gene via double minutes is initiated by chromosome breaks. Proc. Nat. Acad. Sci. 97: 7921- 7926, 2000. ; and

[9558] Craik, C. S.; Rutter, W. J.; Fletterick, R. : Splice junctions: association with variation in protein structure. Science 220: 1125- 1129, 1983.

[9559] Further studies establishing the function and utilities of DHFR are found in John Hopkins OMIM database record ID 126060, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fibroblast growth

factor receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, crouzon syndrome, pfeiffer syndrome, jackson-weiss syndrome) (FGFR2, Accession NM_023031.1) is another GAM64 target gene, herein designated TARGET GENE. FGFR2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FGFR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGFR2 BINDING SITE, designated SEQ ID:6486, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9560] Another function of GAM64 is therefore inhibition of Fibroblast growth factor receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, crouzon syndrome, pfeiffer syndrome, jackson-weiss syndrome) (FGFR2, Accession NM_023031.1) . Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR2.

[9561] Gdnf family receptor alpha 1 (GFRA1, Accession NM_145793.1) is another GAM64 target gene, herein des-

ignated TARGET GENE. GFRA1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by GFRA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GFRA1 BINDING SITE, designated SEQ ID:17656, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9562] Another function of GAM64 is therefore inhibition of Gdnf family receptor alpha 1 (GFRA1, Accession NM_145793.1), a gene which mediates the gdnf- induced autophosphorylation and activation of the ret receptor (by similarity). and therefore may be associated with Hirschsprung disease. Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of Hirschsprung disease., and of other diseases and clinical conditions associated with GFRA1.

[9563] The function of GFRA1 has been established by previous studies. Glial cell line- derived neurotrophic factor (GDNF; 600837) is a potent neurotrophic factor that affects several types of neurons from both the central and peripheral nervous systems. Jing et al. (1996) reported the expression cloning and characterization of rat GDNFR- alpha, a

glycosylphosphatidylinositol- linked cell surface receptor for GDNF. They used the rat cDNA to isolate cDNAs corresponding to the human gene, encoding a deduced 465-amino acid polypeptide that shares 93% sequence identity with the rat protein. The authors showed that recombinant GDNFR bound GDNF specifically and mediated activation of the RET protein- tyrosine kinase (RET; 164761). They noted that loss- of- function mutations in RET are involved in Hirschsprung disease (OMIM Ref. No. 142623), which is characterized by the congenital absence of parasympathetic innervation of the lower intestinal tract. Targeted disruption of the RET protooncogene in mice results in renal agenesis or severe dysgenesis and lack of enteric neurons throughout the digestive tract. This phenotype closely resembles that of GDNF knockout mice, suggesting that both RET and GDNF are involved in signal transduction pathways critical to the development of the kidney and the enteric nervous system. Jing et al. (1996) proposed a model for the stepwise formation of GDNF signal- transducing complex, including GDNF, GDNFR- alpha, and the RET protein- tyrosine kinase. Using fluorescence in situ hybridization, Gorodinsky et al. (1997) and Eng et al. (1998) mapped the GFRA1 gene to 10q26. She-

felbine et al. (1998) mapped GFRA1 to chromosome 10q25- q26 by radiation hybrid mapping. Puliti et al. (1997) mapped the Gfra1 gene to mouse chromosome 19 in a region with known homology to human 10q24- q26. Puliti et al. (1997) commented on the possibility that GFRA1 is a candidate gene for Hirschsprung disease.

[9564]

[9565] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9566] Jing, S.; Wen, D.; Yu, Y.; Holst, P. L.; Luo, Y.; Fang, M.; Tamir, R.; Antonio, L.; Hu, Z.; Cupples, R.; Louis, J.- C.; Hu, S.; Altrock, B. W.; Fox, G. M. : GDNF- induced activation of the Ret protein tyrosine kinase is mediated by GDNFR- alpha, a novel receptor for GDNF. Cell 85: 1113- 1124, 1996. ; and

[9567] Puliti, A.; Cinti, R.; Seri, M.; Ceccherini, I.; Romeo, G. : Assignment of mouse Gfra1, the homologue of a new human HSCR candidate gene, to the telomeric region of mouse chromosome 19.

[9568] Further studies establishing the function and utilities of GFRA1 are found in John Hopkins OMIM database record ID 601496, and in cited publications listed in Table 5,

which are hereby incorporated by reference.KIAA1169 (Accession) is another GAM64 target gene, herein designated TARGET GENE. KIAA1169 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1169, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1169 BINDING SITE, designated SEQ ID:12904, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9569] Another function of GAM64 is therefore inhibition of KIAA1169 (Accession) . Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1169.

[9570] KIAA1396 (Accession XM_032054.2) is another GAM64 target gene, herein designated TARGET GENE. KIAA1396 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1396, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1396 BINDING SITE, designated SEQ ID:13496, to the

nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9571] Another function of GAM64 is therefore inhibition of KIAA1396 (Accession XM_032054.2) . Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1396.

[9572] KIAA1509 (Accession XM_029353.1) is another GAM64 target gene, herein designated TARGET GENE. KIAA1509 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1509, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1509 BINDING SITE, designated SEQ ID:10614, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9573] Another function of GAM64 is therefore inhibition of KIAA1509 (Accession XM_029353.1) . Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1509.

[9574] KIAA1691 (Accession XM_166523.1) is another GAM64

target gene, herein designated TARGET GENE. KIAA1691 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1691, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1691 BINDING SITE, designated SEQ ID:5765, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9575] Another function of GAM64 is therefore inhibition of KIAA1691 (Accession XM_166523.1) . Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1691.

[9576] LOC144667 (Accession XM_096648.1) is another GAM64 target gene, herein designated TARGET GENE. LOC144667 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144667, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144667 BINDING SITE, designated SEQ ID:10853, to the nucleotide sequence of GAM64 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:239.

[9577] Another function of GAM64 is therefore inhibition of LOC144667 (Accession XM_096648.1) . Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144667.

[9578] LOC197350 (Accession XM_113871.3) is another GAM64 target gene, herein designated TARGET GENE. LOC197350 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC197350, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197350 BINDING SITE, designated SEQ ID:15432, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9579] Another function of GAM64 is therefore inhibition of LOC197350 (Accession XM_113871.3) . Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197350.

[9580] LOC220549 (Accession) is another GAM64 target gene, herein designated TARGET GENE. LOC220549 BINDING

SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC220549, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220549 BINDING SITE, designated SEQ ID:11757, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9581] Another function of GAM64 is therefore inhibition of LOC220549 (Accession) . Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220549.

[9582] LOC54466 (Accession) is another GAM64 target gene, herein designated TARGET GENE. LOC54466 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC54466, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC54466 BINDING SITE, designated SEQ ID:9231, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9583] Another function of GAM64 is therefore inhibition of

LOC54466 (Accession) . Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54466.

[9584] MGC11115 (Accession NM_032310.2) is another GAM64 target gene, herein designated TARGET GENE. MGC11115 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC11115, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC11115 BINDING SITE, designated SEQ ID:4324, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9585] Another function of GAM64 is therefore inhibition of MGC11115 (Accession NM_032310.2) . Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11115.

[9586] MGC1842 (Accession XM_037797.4) is another GAM64 target gene, herein designated TARGET GENE. MGC1842 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC1842, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC1842 BINDING SITE, designated SEQ ID:8701, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9587] Another function of GAM64 is therefore inhibition of MGC1842 (Accession XM_037797.4) . Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1842.

[9588] Ndrg family member 4 (NDRG4, Accession NM_020465.1) is another GAM64 target gene, herein designated TARGET GENE. NDRG4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NDRG4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NDRG4 BINDING SITE, designated SEQ ID:19628, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9589] Another function of GAM64 is therefore inhibition of Ndrg family member 4 (NDRG4, Accession NM_020465.1) . Accordingly, utilities of GAM64 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with NDRG4.

[9590] Pdz domain containing 2 (PDZD2, Accession) is another GAM64 target gene, herein designated TARGET GENE. PDZD2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PDZD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDZD2 BINDING SITE, designated SEQ ID:8880, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9591] Another function of GAM64 is therefore inhibition of Pdz domain containing 2 (PDZD2, Accession) . Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZD2.

[9592] Rad50 homolog (s. cerevisiae) (RAD50, Accession NM_005732.2) is another GAM64 target gene, herein designated TARGET GENE. RAD50 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by RAD50, corresponding to a target binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAD50 BINDING SITE, designated SEQ ID:12678, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9593] Another function of GAM64 is therefore inhibition of Rad50 homolog (s. cerevisiae) (RAD50, Accession NM_005732.2), a gene which is involved in dna double-strand break repair (dsbr). and therefore may be associated with Myeloid leukemia and breast cancer. Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of Myeloid leukemia and breast cancer, and of other diseases and clinical conditions associated with RAD50.

[9594] The function of RAD50 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM34.1.Ralbp1 associated eps domain containing 2 (REPS2, Accession NM_004726.1) is another GAM64 target gene, herein designated TARGET GENE. REPS2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by REPS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of REPS2 BINDING SITE, designated SEQ ID:7876, to the nucleotide sequence of GAM64 RNA, herein designated GAM RNA, also designated SEQ ID:239.

[9595] Another function of GAM64 is therefore inhibition of Ralbp1 associated eps domain containing 2 (REPS2, Accession NM_004726.1), a gene which interacts with the active form of RAS with adaptor protein GRB2 and binds calcium. Accordingly, utilities of GAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REPS2.

[9596] The function of REPS2 has been established by previous studies. Small G proteins have GDP- bound inactive and GTP- bound active forms; RAL proteins (e.g., RALA; 179550) shift from the inactive to the active state through the actions of RALGDS (OMIM Ref. No. 601619). RALGDS interacts with the active form of RAS (see OMIM Ref. No. HRAS; 190020). Using RALA- binding protein- 1 (RALBP1; 605801) as bait in a yeast 2- hybrid screen of a brain cDNA library, Ikeda et al. (1998) isolated cDNAs encoding REPS2, which they termed POB1. Sequence analysis predicted that the 521- amino acid protein has 2 potential

initiator methionines in its N terminus, a central EPS15 (OMIM Ref. No. 600051)- like domain, and 2 proline- rich regions and a putative coiled- coil structure in its C terminus. Northern blot analysis revealed strong expression in rat cerebrum, cerebellum, lung, and testis, with weak expression in kidney and no expression in heart, thymus, liver, spleen, or adrenal gland. Immunoprecipitation and immunoblot analyses confirmed that the C- terminal 146 amino acids of REPS2 and the C- terminal 147 residues of RALBP1 interact in intact cells. RAL interacts with a distinct region of RALBP1, just N terminal of the REPS2- binding domain, and both proteins can interact simultaneously with RALBP1. Immunoblot analysis established that REPS2 is tyrosine phosphorylated in response to epidermal growth factor (EGF; 131530) and interacts with the EGF receptor (EGFR; 131550), possibly through the adaptor protein GRB2 (OMIM Ref. No. 108355), with which REPS2 interacts specifically. Using nuclear magnetic resonance spectroscopy, Koshiba et al. (1999) showed that the EPS15 homology domain of REPS2 consists of 2 EF- hand structures, the second of which binds calcium.

[9597]

[9598] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[9599] Ikeda, M.; Ishida, O.; Hinoi, T.; Kishida, S.; Kikuchi, A. : Identification and characterization of a novel protein interacting with Ral- binding protein 1, a putative effector protein of Ral. J. Biol. Chem. 273: 814- 821, 1998. ; and

[9600] Koshiba, S.; Kigawa, T.; Iwahara, J.; Kikuchi, A.; Yokoyama, S. : Solution structure of the Eps15 homology domain of a human POB1 (partner of RalBP1). FEBS Lett. 442: 138-142, 1999.

[9601] Further studies establishing the function and utilities of REPS2 are found in John Hopkins OMIM database record ID 300317, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[9602] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 65 (GAM65), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9603] GAM65 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM65 was detected is described hereinabove

with reference to Figs. 8-15.

[9604] GAM65 gene, herein designated GAM GENE, and GAM65 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[9605] GAM65 gene encodes a GAM65 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM65 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM65 precursor RNA is designated SEQ ID:33, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:33 is located at position 72936952 relative to chromosome 14.

[9606] GAM65 precursor RNA folds onto itself, forming GAM65 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9607] GAM65 precursor RNA folds onto itself, forming GAM65

folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[9608] Nucleotide sequence of GAM65 precursor RNA, designated SEQ-ID: 33, and a schematic representation of a predicted secondary folding of GAM65 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[9609] An enzyme complex designated DICER COMPLEX, `dices` the GAM65 folded precursor RNA into GAM65 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM65 RNA is designated SEQ ID:272, and is provided hereinbelow with references to the

sequence listing part and Table 3, hereby incorporated by reference.

[9610] GAM65 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM65 target RNA, herein designated GAM TARGET RNA. GAM65 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9611] GAM65 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM65 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM65 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM65 RNA may have a different number of target binding sites in untranslated regions of a GAM65 target

RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9612] The complementary binding of GAM65 RNA, herein designated GAM RNA, to target binding sites on GAM65 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM65 target RNA into GAM65 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9613] It is appreciated that GAM65 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM65 target genes. The mRNA of each one of this plurality of GAM65 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM65 RNA, herein designated GAM RNA, and which when bound by GAM65 RNA causes inhibition of translation of respective one or more GAM65 target proteins.

[9614] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with

specific reference to translational inhibition exerted by GAM65 gene, herein designated GAM GENE, on one or more GAM65 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9615] It is appreciated that specific functions and accordingly utilities of GAM65 correlate with, and may be deduced from, the identity of the target genes which GAM65 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9616]

[9617]

[9618] Activating transcription factor 3 (ATF3, Accession

NP_001665.1) is a GAM65 target gene, herein designated TARGET GENE. ATF3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ATF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATF3 BINDING SITE, designated SEQ ID:7146, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9619] A function of GAM65 is therefore inhibition of Activating transcription factor 3 (ATF3, Accession NP_001665.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF3.

[9620] Activating transcription factor 3 (ATF3, Accession NP_004015.2) is another GAM65 target gene, herein designated TARGET GENE. ATF3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ATF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATF3

BINDING SITE, designated SEQ ID:7146, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9621] Another function of GAM65 is therefore inhibition of Activating transcription factor 3 (ATF3, Accession NP_004015.2) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF3.

[9622] Bystin-like (BYSL, Accession NP_004044.2) is another GAM65 target gene, herein designated TARGET GENE. BYSL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BYSL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BYSL BINDING SITE, designated SEQ ID:7672, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9623] Another function of GAM65 is therefore inhibition of Bystin-like (BYSL, Accession NP_004044.2), a gene which could be involved with trophinin and tastin in a cell adhesion molecule complex. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with BYSL.

[9624] The function of BYSL has been established by previous studies. Trophinin (OMIM Ref. No. 300132) and tastin (OMIM Ref. No. 603872) form a cell adhesion molecule complex that may be involved in mediating the initial attachment of the blastocyst to uterine epithelial cells at the time of implantation. However, Suzuki et al. (1998) found that trophinin and tastin do not bind to each other directly in vitro or in yeast 2- hybrid assays. By using an expression assay, these authors isolated a cDNA that allowed COS- 1 cells expressing trophinin to adhere to the upper surfaces of SNG- M endometrial adenocarcinoma cells. The cDNA encoded a predicted 306- amino acid protein that they named 'bystin' because it is 53% identical to Drosophila bys (symbolizing 'by the ribosomal protein S6 gene'), or mrr (myosin rod- related), protein. Bystin has an apparent molecular weight of 35 kD. Northern blot analysis revealed that bystin is expressed as a 2- kb major transcript and a 3.6- kb minor transcript in SNG- M cells and in human trophoblastic teratocarcinoma HT- H cells. Using yeast 2- and 3- hybrid assays and in vitro protein binding assays, Suzuki et al. (1998) determined that bystin binds directly to trophinin and tastin, and that this

binding is enhanced when cytokeratins 8 (OMIM Ref. No. 148060) and 18 (OMIM Ref. No. 148070) are present. Immunocytochemistry of HT- H cells showed that bystin colocalizes with trophinin, tastin, and the cytokeratins. The authors suggested that these molecules form a complex in trophectoderm cells at the time of implantation. Using immunohistochemistry, Suzuki et al. (1999) determined that trophinin and bystin are found in the placenta from the sixth week of pregnancy. Both proteins were localized in the cytoplasm of the syncytiotrophoblast in the chorionic villi and in endometrial decidual cells at the uteroplacental interface. After week 10, the levels of trophinin, tastin, and bystin decreased and then disappeared from placental villi.

[9625]

[9626] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9627] Suzuki, N.; Nakayama, J.; Shih, I. M.; Aoki, D.; Nozawa, S.; Fukuda, M. N. : Expression of trophinin, tastin, and bystin by trophoblast and endometrial cells in human placenta. Biol. Reprod. 60: 621- 627, 1999. ; and

[9628] Suzuki, N.; Zara, J.; Sato, T.; Ong, E.; Bakhiet, N.; Oshima,

R. G.; Watson, K. L.; Fukuda, M. N. : A cytoplasmic protein, bystin, interacts with trophinin, tastin, and cytokeratin and.

[9629] Further studies establishing the function and utilities of BYSL are found in John Hopkins OMIM database record ID 603871, and in cited publications listed in Table 5, which are hereby incorporated by reference.Carbonic anhydrase iii, muscle specific (CA3, Accession NP_005172.1) is another GAM65 target gene, herein designated TARGET GENE. CA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CA3 BINDING SITE, designated SEQ ID:9592, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9630] Another function of GAM65 is therefore inhibition of Carbonic anhydrase iii, muscle specific (CA3, Accession NP_005172.1), a gene which has a muscle- specific function of reversible hydratation of carbon dioxide. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with CA3.

[9631] The function of CA3 has been established by previous studies. Carbonic anhydrases (CAs) are a family of zinc metalloenzymes. Carbonic anhydrase III is found in high concentration in muscle. It shows relatively poor hydratase and esterase activities compared to the red cell isozymes CA I (OMIM Ref. No. 114800) and CA II (OMIM Ref. No. 259730), but is similar in subunit structure (monomer) and molecular mass (28 kD). Heath et al. (1985) explored the use of CA III in conjunction with creatine kinase detection of the carrier state for Duchenne muscular dystrophy.

[9632]

[9633] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9634] Heath, R.; Carter, N. D.; Jeffery, S.; Edwards, R. J.; Watts, D. C.; Watts, R. L. : Evaluation of carrier detection of Duchenne muscular dystrophy using carbonic anhydrase III and creatine kinase. Am. J. Med. Genet. 21: 291- 296, 1985. ; and

[9635] Edwards, Y. H.; Lloyd, J. C.; Parkar, M.; Povey, S. : The gene for human muscle specific carbonic anhydrase (CAIII)

is assigned to chromosome 8. Ann. Hum. Genet. 50: 41-47, 1986.

[9636] Further studies establishing the function and utilities of CA3 are found in John Hopkins OMIM database record ID 114750, and in cited publications listed in Table 5, which are hereby incorporated by reference.Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_005084.1) is another GAM65 target gene, herein designated TARGET GENE. CBFA2T2 BINDING SITE is a target binding site found in the 3` un-translated region of multiple transcripts of mRNA encoded by CBFA2T2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-cleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:14682, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9637] Another function of GAM65 is therefore inhibition of Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_005084.1), a gene which is a putative transcription factor. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with CBFA2T2.

[9638] The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.1.Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_787060.1) is another GAM65 target gene, herein designated TARGET GENE. CBFA2T2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CBFA2T2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:14682, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9639] Another function of GAM65 is therefore inhibition of Core-binding factor, runt domain, alpha subunit 2; translocated to, 2 (CBFA2T2, Accession NP_787060.1), a gene which is a putative transcription factor. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2.

[9640] The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.1.Cd8 antigen, alpha polypeptide (p32) (CD8A, Accession NP_741969.1) is another GAM65 target gene, herein designated TARGET GENE. CD8A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CD8A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD8A BINDING SITE, designated SEQ ID:11570, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9641] Another function of GAM65 is therefore inhibition of Cd8 antigen, alpha polypeptide (p32) (CD8A, Accession NP_741969.1), a gene which is thought to play a role in the process of t- cell mediated killing. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD8A.

[9642] The function of CD8A has been established by previous studies. Comparative structural and functional studies of

mouse and human T- cell antigens showed that human cytotoxic- suppressor T cells have a molecule homologous to the mouse Lyt- 2,Lyt- 3 molecule (Ledbetter et al., 1981). The human homolog of Lyt- 2,Lyt- 3 is termed LEU2. It is selectively expressed on a subset of T cells and in structure is a multimeric macromolecule composed of individual disulfide- bonded subunits. LEU2, or T8, is expressed by most T lymphocytes with cytotoxic or suppressor function. The molecule appears to be composed of multimers of a 32- kD and a 45- kD polypeptide in thymocytes and of a 32- kD polypeptide in peripheral blood lymphocytes. LEU2 (like its proposed murine homolog Lyt- 2) may play a role in target- cell recognition. Kavathas et al. (1984) isolated genomic and cDNA clones for LEU2. Giblin et al. (1989) showed that through alternative splicing of mRNA, an exon encoding a transmembrane domain of CD8 is deleted. This gives rise to a 30-kD molecule that is secreted and exists as a monomer. The splicing pattern in man differs from that found in the mouse CD8 gene. This mRNA is also alternatively spliced, but an exon encoding a cytoplasmic region is deleted, giving rise to a cell surface molecule that differs in its cytoplasmic tail from the protein encoded by the longer

mRNA. Neither protein is secreted. This is an example of the different splicing patterns of 2 homologous mouse and human genes giving rise to different proteins. This represents 1 mechanism of generating diversity during speciation

[9643] Animal model experiments lend further support to the function of CD8A. Leishman et al. (2001) used tetramer analysis in a mouse model to show that thymus leukemia antigen (TL; 188850), which is expressed abundantly on intestinal epithelial cells, preferentially binds to the homotypic form of CD8A (CD8A- CD8A), in contrast to other major histocompatibility complex molecules that bind to CD8A- CD8B (OMIM Ref. No. 186730). Flow cytometric analysis demonstrated that most intestinal intraepithelial lymphocytes (IELs), but not splenocytes, react specifically to TL tetramers. Leishman et al. (2001) concluded that CD8A- CD8A on IELs acts semiautonomously, rather than as a T- cell receptor coreceptor. They suggested that expression of CD8A- CD8A on IELs could have important regulatory effects that influence homeostasis, activation, and survival of IELs under the high antigen load of the intestine

[9644] It is appreciated that the abovementioned animal model

for CD8A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[9645] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9646] Kavathas, P.; Sukhatme, V. P.; Herzenberg, L. A.; Parnes, J. R. : Isolation of the gene encoding the human T- lymphocyte differentiation antigen Leu- 2 (T8) by gene transfer and cDNA subtraction. Proc. Nat. Acad. Sci. 81: 7688-7692, 1984. ; and

[9647] Leishman, A. J.; Naidenko, O. V.; Attinger, A.; Koning, F.; Lena, C. J.; Xiong, Y.; Chang, H.- C.; Reinherz, E.; Kronenberg, M.; Cheroutre, H. : T cell responses modulated through interac.

[9648] Further studies establishing the function and utilities of CD8A are found in John Hopkins OMIM database record ID 186910, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cd8 antigen, alpha polypeptide (p32) (CD8A, Accession NP_001759.3) is another GAM65 target gene, herein designated TARGET GENE. CD8A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of

mRNA encoded by CD8A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CD8A BINDING SITE, designated SEQ ID:11570, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9649] Another function of GAM65 is therefore inhibition of Cd8 antigen, alpha polypeptide (p32) (CD8A, Accession NP_001759.3), a gene which is thought to play a role in the process of t- cell mediated killing. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD8A.

[9650] The function of CD8A has been established by previous studies. Comparative structural and functional studies of mouse and human T- cell antigens showed that human cytotoxic- suppressor T cells have a molecule homologous to the mouse Lyt- 2,Lyt- 3 molecule (Ledbetter et al., 1981). The human homolog of Lyt- 2,Lyt- 3 is termed LEU2. It is selectively expressed on a subset of T cells and in structure is a multimeric macromolecule composed of individual disulfide- bonded subunits. LEU2, or T8, is ex-

pressed by most T lymphocytes with cytotoxic or suppressor function. The molecule appears to be composed of multimers of a 32- kD and a 45- kD polypeptide in thymocytes and of a 32- kD polypeptide in peripheral blood lymphocytes. LEU2 (like its proposed murine homolog Lyt- 2) may play a role in target- cell recognition. Kavathas et al. (1984) isolated genomic and cDNA clones for LEU2. Giblin et al. (1989) showed that through alternative splicing of mRNA, an exon encoding a transmembrane domain of CD8 is deleted. This gives rise to a 30-kD molecule that is secreted and exists as a monomer. The splicing pattern in man differs from that found in the mouse CD8 gene. This mRNA is also alternatively spliced, but an exon encoding a cytoplasmic region is deleted, giving rise to a cell surface molecule that differs in its cytoplasmic tail from the protein encoded by the longer mRNA. Neither protein is secreted. This is an example of the different splicing patterns of 2 homologous mouse and human genes giving rise to different proteins. This represents 1 mechanism of generating diversity during speciation

[9651] Animal model experiments lend further support to the function of CD8A. Leishman et al. (2001) used tetramer

analysis in a mouse model to show that thymus leukemia antigen (TL; 188850), which is expressed abundantly on intestinal epithelial cells, preferentially binds to the homotypic form of CD8A (CD8A- CD8A), in contrast to other major histocompatibility complex molecules that bind to CD8A- CD8B (OMIM Ref. No. 186730). Flow cytometric analysis demonstrated that most intestinal intraepithelial lymphocytes (IELs), but not splenocytes, react specifically to TL tetramers. Leishman et al. (2001) concluded that CD8A- CD8A on IELs acts semiautonomously, rather than as a T- cell receptor coreceptor. They suggested that expression of CD8A- CD8A on IELs could have important regulatory effects that influence homeostasis, activation, and survival of IELs under the high antigen load of the intestine

[9652] It is appreciated that the abovementioned animal model for CD8A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[9653] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9654] Kavathas, P.; Sukhatme, V. P.; Herzenberg, L. A.; Parnes, J.

R. : Isolation of the gene encoding the human T- lymphocyte differentiation antigen Leu- 2 (T8) by gene transfer and cDNA subtraction. Proc. Nat. Acad. Sci. 81: 7688-7692, 1984. ; and

[9655] Leishman, A. J.; Naidenko, O. V.; Attinger, A.; Koning, F.; Lena, C. J.; Xiong, Y.; Chang, H.- C.; Reinherz, E.; Kronenberg, M.; Cheroutre, H. : T cell responses modulated through interac.

[9656] Further studies establishing the function and utilities of CD8A are found in John Hopkins OMIM database record ID 186910, and in cited publications listed in Table 5, which are hereby incorporated by reference.Carboxylesterase 1 (monocyte/macrophage serine esterase 1) (CES1, Accession NP_001257.3) is another GAM65 target gene, herein designated TARGET GENE. CES1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CES1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CES1 BINDING SITE, designated SEQ ID:12659, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9657] Another function of GAM65 is therefore inhibition of Car-

boxylesterase 1 (monocyte/macrophage serine esterase 1) (CES1, Accession NP_001257.3) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CES1.

[9658] Chromogranin b (secretogranin 1) (CHGB, Accession NP_001810.1) is another GAM65 target gene, herein designated TARGET GENE. CHGB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHGB BINDING SITE, designated SEQ ID:7161, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9659] Another function of GAM65 is therefore inhibition of Chromogranin b (secretogranin 1) (CHGB, Accession NP_001810.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHGB.

[9660] CML66 (Accession NP_116258.1) is another GAM65 target gene, herein designated TARGET GENE. CML66 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CML66, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CML66 BINDING SITE, designated SEQ ID:10642, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9661] Another function of GAM65 is therefore inhibition of CML66 (Accession NP_116258.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CML66.

[9662] Csrp2 binding protein (CSRP2BP, Accession NP_808779.1) is another GAM65 target gene, herein designated TARGET GENE. CSRP2BP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CSRP2BP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSRP2BP BINDING SITE, designated SEQ ID:19687, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9663] Another function of GAM65 is therefore inhibition of Csrp2 binding protein (CSRP2BP, Accession NP_808779.1)

. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSRP2BP.

[9664] Csrp2 binding protein (CSRP2BP, Accession NP_065397.1) is another GAM65 target gene, herein designated TARGET GENE. CSRP2BP BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CSRP2BP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSRP2BP BINDING SITE, designated SEQ ID:19687, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9665] Another function of GAM65 is therefore inhibition of Csrp2 binding protein (CSRP2BP, Accession NP_065397.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSRP2BP.

[9666] Chemokine (c-x3-c motif) ligand 1 (CX3CL1, Accession NP_002987.1) is another GAM65 target gene, herein designated TARGET GENE. CX3CL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by CX3CL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CX3CL1 BINDING SITE, designated SEQ ID:17574, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9667] Another function of GAM65 is therefore inhibition of Chemokine (c-x3-c motif) ligand 1 (CX3CL1, Accession NP_002987.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CX3CL1.

[9668] Dead/h (asp-glu-ala-asp/his) box polypeptide, y chromosome (DBY, Accession NP_004651.2) is another GAM65 target gene, herein designated TARGET GENE. DBY BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DBY, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DBY BINDING SITE, designated SEQ ID:3439, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9669] Another function of GAM65 is therefore inhibition of Dead/h (asp-glu-ala-asp/his) box polypeptide, y chromosome (DBY, Accession NP_004651.2), a gene which plays a key role in the spermatogenic process. and therefore may be associated with Male infertility. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of Male infertility., and of other diseases and clinical conditions associated with DBY.

[9670] The function of DBY has been established by previous studies. Foresta et al. (2000) reported a complete sequence map of the AZFa region (see OMIM Ref. No. 415000), the genomic structure of AZFa genes, and their deletion analysis in 173 infertile men with well- defined spermatogenic alterations. Deletions were found in 9 patients: DBY alone was deleted in 6, USP9Y only in 1, and 1 each with USP9Y- DBY or DBY- UTY missing. No patients solely lacked UTY. Patients lacking DBY exhibited either Sertoli cell- only syndrome or severe hypospermatogenesis. Expression analysis of AZFa genes and their X homologs revealed ubiquitous expression for all of them except DBY; a shorter DBY transcript was expressed only in testis. The authors suggested that DBY plays a key role in the spermatogenic process. Using COS cells to express

candidate Y chromosome genes and mouse dendritic cells for antigenic presentation, Scott et al. (2000) determined that Dby expresses 2 major histocompatibility complex (MHC) class II- restricted minor histocompatibility HY determinants. No stimulatory activity was found with these epitopes in cells transfected with Smcy (OMIM Ref. No. 426000) or Uty, both of which express MHC class I- restricted epitopes.

[9671]

[9672] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9673] Foresta, C.; Ferlin, A.; Moro, E. : Deletion and expression analysis of AZFa genes on the human Y chromosome revealed a major role for DBY in male infertility. Hum. Molec. Genet. 9: 1161- 1169, 2000. ; and

[9674] Scott, D.; Addey, C.; Ellis, P; James, E.; Mitchell, M. J.; Saut, N.; Jurcevic, S.; Simpson, E. : Dendritic cells permit identification of genes encoding MHC class II- restricted epitope.

[9675] Further studies establishing the function and utilities of DBY are found in John Hopkins OMIM database record ID 400010, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Eh-domain containing 1 (EHD1, Accession NP_006786.2) is another GAM65 target gene, herein designated TARGET GENE. EHD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EHD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EHD1 BINDING SITE, designated SEQ ID:2264, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9676] Another function of GAM65 is therefore inhibition of Eh-domain containing 1 (EHD1, Accession NP_006786.2), a gene which may be involved in ligand- initiated endocytosis. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHD1.

[9677] The function of EHD1 has been established by previous studies. By screening a human cerebellar cDNA library with a mouse genomic fragment, Mintz et al. (1999) isolated a cDNA which was then used as a probe to screen a mouse brain cDNA library. The sequences of the deduced human and mouse proteins, designated EHD1, contain

534 amino acids and share approximately 94% homology. Both proteins have an EH domain, including an EF-Ca(2+)- binding motif, at their C terminus, a highly conserved ATP/GTP- binding domain, and a central coiled-coil structure. Cotransfection experiments indicated that the human EHD1 protein has a molecular mass of 62 kD. Northern blot analysis indicated the existence of 2 EHD1 RNA species in mouse and 3 in human (2.0, 3.2, 3.6 kb). In mouse, both transcripts are highly expressed in testis and are present in kidney, heart, intestine, and brain. In human, the smallest transcript is predominant in testis, while the largest transcript is present in other tissues as well. RT- PCR analysis indicated that the 3.2- kb mRNA results from skipping of exon 3. Subcellular localization experiments indicated that EHD1 colocalizes with transferrin- containing endocytic vesicles. EHD1 was also present in other cellular structures, including the Golgi apparatus. Immunohistochemical analyses in mice demonstrated EHD1 expression in male germ cells, in adipocytes, in several retinal layers, and, to a lesser extent, in uterus, skeletal muscle, and kidney. In situ hybridization and immunohistochemical analyses indicated that Ehd1 was expressed by day 9.5 in the limb buds and

pharyngeal arches and at day 10.5 in sclerotomes, at various elements of the branchial apparatus, and in the occipital region. At day 15.5 Ehd1 expression peaked in cartilage, preceding hypertrophy and ossification, and at day 17.5 there was no expression in the bones. Rotem- Yehudar et al. (2001) found evidence for a role for EHD1 in the endocytosis of IGF1 receptors (IGF1R; 147370). Through immunoprecipitation of rat tissues, they found that EHD1 interacts directly with the synaptosomal- associated protein SNAP29 (OMIM Ref. No. 604202) and that both are present in complexes with IGF1R. They also found that IGF1 induction of EHD1- transfected CHO cells results in intracellular colocalization of EHD1 and IGF1R.

[9678]

[9679] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9680] Mintz, L.; Galperin, E.; Pasmanik- Chor, M.; Tulzinsky, S.; Bromberg, Y.; Kozak, C. A.; Joyner, A.; Fein, A.; Horowitz, M. : EHD1- - an EH- domain- containing protein with a specific expression pattern. Genomics 59: 66- 76, 1999. ; and

[9681] Rotem- Yehudar, R.; Galperin, E.; Horowitz, M. : Associa-

tion of insulin- like growth factor 1 receptor with EHD1 and SNAP29. J. Biol. Chem. 276: 33054- 33060, 2001.

[9682] Further studies establishing the function and utilities of EHD1 are found in John Hopkins OMIM database record ID 605888, and in cited publications listed in Table 5, which are hereby incorporated by reference.Er to nucleus signalling 1 (ERN1, Accession NP_001424.1) is another GAM65 target gene, herein designated TARGET GENE. ERN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ERN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ERN1 BINDING SITE, designated SEQ ID:17882, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9683] Another function of GAM65 is therefore inhibition of Er to nucleus signalling 1 (ERN1, Accession NP_001424.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERN1.

[9684] FLJ00024 (Accession XP_033361.2) is another GAM65 target gene, herein designated TARGET GENE. FLJ00024

BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by FLJ00024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:1895, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9685] Another function of GAM65 is therefore inhibition of FLJ00024 (Accession XP_033361.2) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024.

[9686] FLJ00024 (Accession NP_203745.1) is another GAM65 target gene, herein designated TARGET GENE. FLJ00024 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by FLJ00024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:1895, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9687] Another function of GAM65 is therefore inhibition of

FLJ00024 (Accession NP_203745.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024.

[9688] FLJ20400 (Accession NP_060274.1) is another GAM65 target gene, herein designated TARGET GENE. FLJ20400 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20400, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20400 BINDING SITE, designated SEQ ID:1121, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9689] Another function of GAM65 is therefore inhibition of FLJ20400 (Accession NP_060274.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20400.

[9690] FLJ20514 (Accession NP_060326.1) is another GAM65 target gene, herein designated TARGET GENE. FLJ20514 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20514, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ20514 BINDING SITE, designated SEQ ID:7512, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9691] Another function of GAM65 is therefore inhibition of FLJ20514 (Accession NP_060326.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20514.

[9692] FLJ30634 (Accession NP_694559.1) is another GAM65 target gene, herein designated TARGET GENE. FLJ30634 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30634, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30634 BINDING SITE, designated SEQ ID:5870, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9693] Another function of GAM65 is therefore inhibition of FLJ30634 (Accession NP_694559.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30634.

[9694] FLJ35155 (Accession NP_689744.2) is another GAM65 tar-

get gene, herein designated TARGET GENE. FLJ35155 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ35155, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35155 BINDING SITE, designated SEQ ID:13879, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9695] Another function of GAM65 is therefore inhibition of FLJ35155 (Accession NP_689744.2) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35155.

[9696] Gamma-aminobutyric acid (gaba) a receptor, epsilon (GABRE, Accession NP_068822.1) is another GAM65 target gene, herein designated TARGET GENE. GABRE BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by GABRE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABRE BINDING SITE, designated SEQ ID:12964, to the nucleotide sequence of GAM65 RNA,

herein designated GAM RNA, also designated SEQ ID:272.

[9697] Another function of GAM65 is therefore inhibition of Gamma-aminobutyric acid (gaba) a receptor, epsilon (GABRE, Accession NP_068822.1), a gene which mediates neuronal inhibition by binding to the gaba/ benzodiazepine receptor and opening an integral chloride channel. and therefore may be associated with Early- onset parkinsonism (or waisman syndrome), mrx3 (a form of x- linked mental retardation). Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of Early- onset parkinsonism (or waisman syndrome), mrx3 (a form of x- linked mental retardation), and of other diseases and clinical conditions associated with GABRE.

[9698] The function of GABRE has been established by previous studies. Davies et al. (1997) described a member of a new class of human GABA(A) receptor subunit, the epsilon subunit. The subunit was detected in the brain and can assemble with alpha and beta subunits. Wilke et al. (1997) also identified a cDNA sequence of a gene coding for a 506- amino acid protein, representing a member of a putative new class (epsilon) of the GABA- A receptor. The gene, symbolized GABRE, encodes a polypeptide almost identical to the one reported by Davies et al. (1997).

GABRE was transcribed in several different tissues, with the highest levels being detected in adult heart and placenta. Wilke et al. (1997) observed alternative splicing of GABRE transcripts isolated from different tissues at multiple positions of the gene, yielding an unusually complex variety of cDNA variants. The structure of the 5- prime region of most cDNAs is compatible with expression of GABRE in adult brain only, whereas in other tissues, most transcripts code for truncated protein sequences. The GABRE gene extends over 14 kb and is clustered together with the alpha- 3 (OMIM Ref. No. 305660) and the putative beta- 4 GABA- A receptor subunit genes in an interval of approximately 0.8 Mb in band Xq28. It is located in the candidate regions of 2 different neurologic diseases, early- onset parkinsonism, or Waisman syndrome (OMIM Ref. No. 311510), and MRX3 (OMIM Ref. No. 309541), a form of X- linked mental retardation. Sinkkonen et al. (2000) obtained cDNAs encoding rat Gabre and Gabrq (OMIM Ref. No. 300349), which are highly divergent from their human homologs. They noted that rat Gabre and Gabrq have expression patterns distinct from those reported in primates.

[9699]

[9700] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9701] Davies, P. A.; Hanna, M. C.; Hales, T. G.; Kirkness, E. F. : Insensitivity to anaesthetic agents conferred by a class of GABA(A) receptor subunit. Nature 385: 820- 823, 1997. ; and

[9702] Sinkkonen, S. T.; Hanna, M. C.; Kirkness, E. F.; Korpi, E. R. : GABA- A receptor epsilon and theta subunits display unusual structural variation between species and are enriched in the r.

[9703] Further studies establishing the function and utilities of GABRE are found in John Hopkins OMIM database record ID 300093, and in cited publications listed in Table 5, which are hereby incorporated by reference.Gamma-aminobutyric acid (gaba) a receptor, epsilon (GABRE, Accession NP_068819.1) is another GAM65 target gene, herein designated TARGET GENE. GABRE BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by GABRE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of GABRE BINDING SITE, designated SEQ ID:12964, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9704] Another function of GAM65 is therefore inhibition of Gamma-aminobutyric acid (gaba) a receptor, epsilon (GABRE, Accession NP_068819.1), a gene which mediates neuronal inhibition by binding to the gaba/ benzodiazepine receptor and opening an integral chloride channel. and therefore may be associated with Early- onset parkinsonism (or waisman syndrome), mrx3 (a form of x- linked mental retardation). Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of Early- onset parkinsonism (or waisman syndrome), mrx3 (a form of x- linked mental retardation), and of other diseases and clinical conditions associated with GABRE.

[9705] The function of GABRE has been established by previous studies. Davies et al. (1997) described a member of a new class of human GABA(A) receptor subunit, the epsilon subunit. The subunit was detected in the brain and can assemble with alpha and beta subunits. Wilke et al. (1997) also identified a cDNA sequence of a gene coding for a 506- amino acid protein, representing a member of a putative new class (epsilon) of the GABA- A receptor. The

gene, symbolized GABRE, encodes a polypeptide almost identical to the one reported by Davies et al. (1997). GABRE was transcribed in several different tissues, with the highest levels being detected in adult heart and placenta. Wilke et al. (1997) observed alternative splicing of GABRE transcripts isolated from different tissues at multiple positions of the gene, yielding an unusually complex variety of cDNA variants. The structure of the 5- prime region of most cDNAs is compatible with expression of GABRE in adult brain only, whereas in other tissues, most transcripts code for truncated protein sequences. The GABRE gene extends over 14 kb and is clustered together with the alpha- 3 (OMIM Ref. No. 305660) and the putative beta- 4 GABA- A receptor subunit genes in an interval of approximately 0.8 Mb in band Xq28. It is located in the candidate regions of 2 different neurologic diseases, early- onset parkinsonism, or Waisman syndrome (OMIM Ref. No. 311510), and MRX3 (OMIM Ref. No. 309541), a form of X- linked mental retardation. Sinkkonen et al. (2000) obtained cDNAs encoding rat Gabre and Gabrq (OMIM Ref. No. 300349), which are highly divergent from their human homologs. They noted that rat Gabre and Gabrq have expression patterns distinct from those re-

ported in primates.

[9709] Sinkkonen, S. T.; Hanna, M. C.; Kirkness, E. F.; Korpi, E. R. : GABA- A receptor epsilon and theta subunits display unusual structural variation between species and are enriched in the r.

[9710] Further studies establishing the function and utilities of GABRE are found in John Hopkins OMIM database record ID 300093, and in cited publications listed in Table 5, which are hereby incorporated by reference.Gamma-aminobutyric acid (gaba) a receptor, epsilon (GABRE, Accession NP_068830.1) is another GAM65 target gene, herein designated TARGET GENE. GABRE BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by GABRE, corresponding to a target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABRE BINDING SITE, designated SEQ ID:12964, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9711] Another function of GAM65 is therefore inhibition of Gamma-aminobutyric acid (gaba) a receptor, epsilon (GABRE, Accession NP_068830.1), a gene which mediates neuronal inhibition by binding to the gaba/ benzodiazepine receptor and opening an integral chloride channel. and therefore may be associated with Early- onset parkinsonism (or waisman syndrome), mrx3 (a form of x- linked mental retardation). Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of Early- onset parkinsonism (or waisman syndrome), mrx3 (a form of x- linked mental retardation), and of other diseases and clinical conditions associated with GABRE.

[9712] The function of GABRE has been established by previous studies. Davies et al. (1997) described a member of a new class of human GABA(A) receptor subunit, the epsilon subunit. The subunit was detected in the brain and can assemble with alpha and beta subunits. Wilke et al. (1997) also identified a cDNA sequence of a gene coding for a

506- amino acid protein, representing a member of a putative new class (epsilon) of the GABA- A receptor. The gene, symbolized GABRE, encodes a polypeptide almost identical to the one reported by Davies et al. (1997). GABRE was transcribed in several different tissues, with the highest levels being detected in adult heart and placenta. Wilke et al. (1997) observed alternative splicing of GABRE transcripts isolated from different tissues at multiple positions of the gene, yielding an unusually complex variety of cDNA variants. The structure of the 5- prime region of most cDNAs is compatible with expression of GABRE in adult brain only, whereas in other tissues, most transcripts code for truncated protein sequences. The GABRE gene extends over 14 kb and is clustered together with the alpha- 3 (OMIM Ref. No. 305660) and the putative beta- 4 GABA- A receptor subunit genes in an interval of approximately 0.8 Mb in band Xq28. It is located in the candidate regions of 2 different neurologic diseases, early- onset parkinsonism, or Waisman syndrome (OMIM Ref. No. 311510), and MRX3 (OMIM Ref. No. 309541), a form of X- linked mental retardation. Sinkkonen et al. (2000) obtained cDNAs encoding rat Gabre and Gabrq (OMIM Ref. No. 300349), which are highly divergent from

their human homologs. They noted that rat Gabre and Gabrq have expression patterns distinct from those reported in primates.

[9713]

[9714] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9715] Davies, P. A.; Hanna, M. C.; Hales, T. G.; Kirkness, E. F. : Insensitivity to anaesthetic agents conferred by a class of GABA(A) receptor subunit. Nature 385: 820- 823, 1997. ; and

[9716] Sinkkonen, S. T.; Hanna, M. C.; Kirkness, E. F.; Korpi, E. R. : GABA- A receptor epsilon and theta subunits display unusual structural variation between species and are enriched in the r.

[9717] Further studies establishing the function and utilities of GABRE are found in John Hopkins OMIM database record ID 300093, and in cited publications listed in Table 5, which are hereby incorporated by reference.GREB1 (Accession NP_683701.1) is another GAM65 target gene, herein designated TARGET GENE. GREB1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GREB1, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GREB1 BINDING SITE, designated SEQ ID:5081, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9718] Another function of GAM65 is therefore inhibition of GREB1 (Accession NP_683701.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GREB1.

[9719] HBP1 (Accession NP_036389.2) is another GAM65 target gene, herein designated TARGET GENE. HBP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HBP1 BINDING SITE, designated SEQ ID:19617, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9720] Another function of GAM65 is therefore inhibition of HBP1 (Accession NP_036389.2) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with HBP1.

[9721] HEMK (Accession NP_057257.1) is another GAM65 target gene, herein designated TARGET GENE. HEMK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HEMK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:6305, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9722] Another function of GAM65 is therefore inhibition of HEMK (Accession NP_057257.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK.

[9723] Heterogeneous nuclear ribonucleoprotein d (au-rich element rna binding protein 1, 37kda) (HNRPD, Accession NP_002129.2) is another GAM65 target gene, herein designated TARGET GENE. HNRPD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HNRPD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates

the complementarity of the nucleotide sequences of HNRPD BINDING SITE, designated SEQ ID:14479, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9724] Another function of GAM65 is therefore inhibition of Heterogeneous nuclear ribonucleoprotein d (au-rich element rna binding protein 1, 37kda) (HNRPD, Accession NP_002129.2) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPD.

[9725] Heterogeneous nuclear ribonucleoprotein d (au-rich element rna binding protein 1, 37kda) (HNRPD, Accession NP_112737.1) is another GAM65 target gene, herein designated TARGET GENE. HNRPD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HNRPD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HNRPD BINDING SITE, designated SEQ ID:14479, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9726] Another function of GAM65 is therefore inhibition of Het-

erogeneous nuclear ribonucleoprotein d (au-rich element rna binding protein 1, 37kda) (HNRPD, Accession NP_112737.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPD.

[9727] Heterogeneous nuclear ribonucleoprotein d (au-rich element rna binding protein 1, 37kda) (HNRPD, Accession NP_112738.1) is another GAM65 target gene, herein designated TARGET GENE. HNRPD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HNRPD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HNRPD BINDING SITE, designated SEQ ID:14479, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9728] Another function of GAM65 is therefore inhibition of Heterogeneous nuclear ribonucleoprotein d (au-rich element rna binding protein 1, 37kda) (HNRPD, Accession NP_112738.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPD.

[9729] Heparan sulfate 2-o-sulfotransferase 1 (HS2ST1, Accession NP_036394.1) is another GAM65 target gene, herein designated TARGET GENE. HS2ST1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HS2ST1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HS2ST1 BINDING SITE, designated SEQ ID:19213, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9730] Another function of GAM65 is therefore inhibition of Heparan sulfate 2-o-sulfotransferase 1 (HS2ST1, Accession NP_036394.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS2ST1.

[9731] HSPC056 (Accession NP_054873.1) is another GAM65 target gene, herein designated TARGET GENE. HSPC056 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSPC056, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

HSPC056 BINDING SITE, designated SEQ ID:8261, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9732] Another function of GAM65 is therefore inhibition of HSPC056 (Accession NP_054873.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC056.

[9733] Integrin, alpha v (vitronectin receptor, alpha polypeptide, antigen cd51) (ITGAV, Accession NP_002201.1) is another GAM65 target gene, herein designated TARGET GENE. ITGAV BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITGAV, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITGAV BINDING SITE, designated SEQ ID:15711, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9734] Another function of GAM65 is therefore inhibition of Integrin, alpha v (vitronectin receptor, alpha polypeptide, antigen cd51) (ITGAV, Accession NP_002201.1), a gene which is a member of the integrin family of cell- surface proteins. Accordingly, utilities of GAM65 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with ITGAV.

[9735] The function of ITGAV has been established by previous studies. A major surface antigen family on human leukocytes includes complement receptor type 3 (CR3A; also called integrin alpha- M, Mac1 or Mo1), lymphocyte function- associated antigen type 1 (LFA- 1; 153370), and p150,95 (Leu M5; 151510). These antigens share a common beta chain (OMIM Ref. No. 116920) of 94 kD, linked noncovalently to 1 of 3 alpha chains distinctive to each. They promote adhesion of granulocytes to each other and to endothelial cell monolayers. The apparent molecular weight of the Mo1 alpha chain is 155 to 165 kD, that of the LFA1 alpha subunit is 180 kD, and that of the Leu M5 subunit is 130 to 150 kD. Pierce et al. (1986) purified human Mo1 to homogeneity from normal granulocytes by affinity chromatography and high performance liquid chromatography (HPLC) and determined the N- terminal amino acid sequence of its alpha subunit. The obtained sequence was identical, except for 2 conservative substitutions, to that of the alpha subunit of Mac1 antigen (Springer et al., 1985). Furthermore, Pierce et al. (1986) found that the N- terminal amino acid sequence of the al-

pha subunit of Mo1 was homologous to the alpha subunit of IIb/IIIa, a glycoprotein that serves similar adhesive functions on platelets and is deficient or defective in Glanzmann thrombasthenia (OMIM Ref. No. 273800). Patients with a history of recurrent bacterial infections and an inherited deficiency of all 3 leukocyte membrane surface antigens are thought to have reduced or absent synthesis of the common beta subunit of the antigen family; see 116920. Inflammation plays an essential role in the initiation and progression of atherosclerosis. Simon et al. (2000) presented evidence that it also has a role in vascular repair after mechanical arterial injury (i.e., percutaneous transluminal coronary angioplasty, or PTCA). In animal models of vascular injury, leukocytes are recruited as a precursor to intimal thickening. Markers of leukocyte activation, in particular, increased expression of Mac1, which is responsible for firm leukocyte adhesion to platelets and fibrinogen on denuded vessels, predict restenosis after PTCA. To determine whether Mac1- mediated leukocyte recruitment is causally related to neointimal formation, Simon et al. (2000) subjected Mac1 knockout mice to a mechanical carotid artery dilation and complete endothelial denudation. They found that the selec-

tive absence of Mac1 impaired transplatelet leukocyte migration into the vessel wall, reducing leukocyte accumulation. Diminished medial leukocyte accumulation was accompanied by markedly reduced neointimal thickening after vascular injury. These data established a role for inflammation in neointimal thickening and suggested that leukocyte recruitment to mechanically injured arteries may prevent restenosis

[9736]

[9737] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9738] Pierce, M. W.; Remold- O'Donnell, E.; Todd, R. F., III; Arnaout, M. A. : N- terminal sequence of human leukocyte glycoprotein Mo1: conservation across species and homology to platelet IIb/IIIa. Biochim. Biophys. Acta 874: 368- 371, 1986. ; and

[9739] Simon, D. I.; Chen, Z.; Seifert, P.; Edelman, E. R.; Ballantyne, C. M.; Rogers, C. : Decreased neointimal formation in Mac- 1 - /- mice reveals a role for inflammation in vascular repair a.

[9740] Further studies establishing the function and utilities of ITGAV are found in John Hopkins OMIM database record

ID 193210, and in cited publications listed in Table 5, which are hereby incorporated by reference.Potassium channel, subfamily k, member 7 (KCNK7, Accession NP_005705.1) is another GAM65 target gene, herein designated TARGET GENE. KCNK7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNK7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNK7 BINDING SITE, designated SEQ ID:19349, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9741] Another function of GAM65 is therefore inhibition of Potassium channel, subfamily k, member 7 (KCNK7, Accession NP_005705.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK7.

[9742] Potassium channel, subfamily k, member 7 (KCNK7, Accession NP_258416.1) is another GAM65 target gene, herein designated TARGET GENE. KCNK7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNK7, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNK7 BINDING SITE, designated SEQ ID:19349, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9743] Another function of GAM65 is therefore inhibition of Potassium channel, subfamily k, member 7 (KCNK7, Accession NP_258416.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK7.

[9744] KIAA0350 (Accession XP_290667.1) is another GAM65 target gene, herein designated TARGET GENE. KIAA0350 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0350, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:594, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9745] Another function of GAM65 is therefore inhibition of KIAA0350 (Accession XP_290667.1) . Accordingly, utilities

of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350.

[9746] KIAA0557 (Accession XP_085507.1) is another GAM65 target gene, herein designated TARGET GENE. KIAA0557 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0557, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:18362, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9747] Another function of GAM65 is therefore inhibition of KIAA0557 (Accession XP_085507.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557.

[9748] KIAA0562 (Accession NP_055519.1) is another GAM65 target gene, herein designated TARGET GENE. KIAA0562 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0562, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0562 BINDING SITE, designated SEQ ID:13255, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9749] Another function of GAM65 is therefore inhibition of KIAA0562 (Accession NP_055519.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0562.

[9750] KIAA0632 (Accession NP_056360.1) is another GAM65 target gene, herein designated TARGET GENE. KIAA0632 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0632, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0632 BINDING SITE, designated SEQ ID:14190, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9751] Another function of GAM65 is therefore inhibition of KIAA0632 (Accession NP_056360.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KIAA0632.

[9752] KIAA0804 (Accession XP_291080.1) is another GAM65 target gene, herein designated TARGET GENE. KIAA0804 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0804, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0804 BINDING SITE, designated SEQ ID:15077, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9753] Another function of GAM65 is therefore inhibition of KIAA0804 (Accession XP_291080.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0804.

[9754] KIAA1349 (Accession XP_047617.4) is another GAM65 target gene, herein designated TARGET GENE. KIAA1349 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1349, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA1349 BINDING SITE, designated SEQ ID:4109, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9755] Another function of GAM65 is therefore inhibition of KIAA1349 (Accession XP_047617.4) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1349.

[9756] KIAA1423 (Accession XP_029703.1) is another GAM65 target gene, herein designated TARGET GENE. KIAA1423 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1423, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1423 BINDING SITE, designated SEQ ID:19203, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9757] Another function of GAM65 is therefore inhibition of KIAA1423 (Accession XP_029703.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1423.

[9758] KIAA2022 (Accession XP_291326.1) is another GAM65 target gene, herein designated TARGET GENE. KIAA2022 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA2022, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA2022 BINDING SITE, designated SEQ ID:18104, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9759] Another function of GAM65 is therefore inhibition of KIAA2022 (Accession XP_291326.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA2022.

[9760] LNIR (Accession NP_112178.1) is another GAM65 target gene, herein designated TARGET GENE. LNIR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LNIR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LNIR BINDING

SITE, designated SEQ ID:18936, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9761] Another function of GAM65 is therefore inhibition of LNIR (Accession NP_112178.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNIR.

[9762] LOC137829 (Accession XP_059923.2) is another GAM65 target gene, herein designated TARGET GENE. LOC137829 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC137829, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC137829 BINDING SITE, designated SEQ ID:6165, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9763] Another function of GAM65 is therefore inhibition of LOC137829 (Accession XP_059923.2) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137829.

[9764] LOC152245 (Accession XP_098182.1) is another GAM65

target gene, herein designated TARGET GENE. LOC152245 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152245, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152245 BINDING SITE, designated SEQ ID:16959, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9765] Another function of GAM65 is therefore inhibition of LOC152245 (Accession XP_098182.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152245.

[9766] LOC154877 (Accession XP_098626.1) is another GAM65 target gene, herein designated TARGET GENE. LOC154877 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC154877, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE, designated SEQ ID:18739, to the nucleotide sequence of GAM65 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:272.

[9767] Another function of GAM65 is therefore inhibition of LOC154877 (Accession XP_098626.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154877.

[9768] LOC220963 (Accession XP_166145.2) is another GAM65 target gene, herein designated TARGET GENE. LOC220963 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220963, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220963 BINDING SITE, designated SEQ ID:20127, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9769] Another function of GAM65 is therefore inhibition of LOC220963 (Accession XP_166145.2) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220963.

[9770] LOC255967 (Accession NP_787050.1) is another GAM65 target gene, herein designated TARGET GENE. LOC255967

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255967, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255967 BINDING SITE, designated SEQ ID:10361, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9771] Another function of GAM65 is therefore inhibition of LOC255967 (Accession NP_787050.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255967.

[9772] LOC283154 (Accession XP_210922.1) is another GAM65 target gene, herein designated TARGET GENE. LOC283154 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283154, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283154 BINDING SITE, designated SEQ ID:1913, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9773] Another function of GAM65 is therefore inhibition of LOC283154 (Accession XP_210922.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283154.

[9774] LOC283170 (Accession XP_208535.1) is another GAM65 target gene, herein designated TARGET GENE. LOC283170 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283170, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283170 BINDING SITE, designated SEQ ID:19931, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9775] Another function of GAM65 is therefore inhibition of LOC283170 (Accession XP_208535.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283170.

[9776] LOC283664 (Accession XP_208773.1) is another GAM65 target gene, herein designated TARGET GENE. LOC283664 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC283664, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283664 BINDING SITE, designated SEQ ID:18325, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9777] Another function of GAM65 is therefore inhibition of LOC283664 (Accession XP_208773.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283664.

[9778] LOC284555 (Accession XP_211518.1) is another GAM65 target gene, herein designated TARGET GENE. LOC284555 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284555, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284555 BINDING SITE, designated SEQ ID:11631, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9779] Another function of GAM65 is therefore inhibition of

LOC284555 (Accession XP_211518.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284555.

[9780] LOC284647 (Accession XP_211569.1) is another GAM65 target gene, herein designated TARGET GENE. LOC284647 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284647, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284647 BINDING SITE, designated SEQ ID:18217, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9781] Another function of GAM65 is therefore inhibition of LOC284647 (Accession XP_211569.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284647.

[9782] LOC285216 (Accession XP_209520.1) is another GAM65 target gene, herein designated TARGET GENE. LOC285216 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285216, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285216 BINDING SITE, designated SEQ ID:5907, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9783] Another function of GAM65 is therefore inhibition of LOC285216 (Accession XP_209520.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285216.

[9784] LOC285806 (Accession XP_212028.1) is another GAM65 target gene, herein designated TARGET GENE. LOC285806 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285806, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285806 BINDING SITE, designated SEQ ID:12618, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9785] Another function of GAM65 is therefore inhibition of LOC285806 (Accession XP_212028.1) . Accordingly, utili-

ties of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285806.

[9786] LOC286374 (Accession XP_212293.1) is another GAM65 target gene, herein designated TARGET GENE. LOC286374 BINDING SITE1 and LOC286374 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC286374, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286374 BINDING SITE1 and LOC286374 BINDING SITE2, designated SEQ ID:7390 and SEQ ID:19118 respectively, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9787] Another function of GAM65 is therefore inhibition of LOC286374 (Accession XP_212293.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286374.

[9788] LOC339556 (Accession XP_290951.1) is another GAM65 target gene, herein designated TARGET GENE. LOC339556 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC339556, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339556 BINDING SITE, designated SEQ ID:11280, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9789] Another function of GAM65 is therefore inhibition of LOC339556 (Accession XP_290951.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339556.

[9790] LOC339929 (Accession XP_295105.1) is another GAM65 target gene, herein designated TARGET GENE. LOC339929 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339929, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339929 BINDING SITE, designated SEQ ID:18421, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9791] Another function of GAM65 is therefore inhibition of

LOC339929 (Accession XP_295105.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339929.

[9792] LOC349037 (Accession XP_302942.1) is another GAM65 target gene, herein designated TARGET GENE. LOC349037 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349037, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349037 BINDING SITE, designated SEQ ID:13327, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9793] Another function of GAM65 is therefore inhibition of LOC349037 (Accession XP_302942.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349037.

[9794] LOC90670 (Accession XP_033352.1) is another GAM65 target gene, herein designated TARGET GENE. LOC90670 BINDING SITE1 and LOC90670 BINDING SITE2 are target binding sites found in untranslated regions of mRNA en-

coded by LOC90670, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90670 BINDING SITE1 and LOC90670 BINDING SITE2, designated SEQ ID:18422 and SEQ ID:2098 respectively, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9795] Another function of GAM65 is therefore inhibition of LOC90670 (Accession XP_033352.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90670.

[9796] Mastermind-like 1 (drosophila) (MAML1, Accession NP_055572.1) is another GAM65 target gene, herein designated TARGET GENE. MAML1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAML1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAML1 BINDING SITE, designated SEQ ID:4165, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ

ID:272.

[9797] Another function of GAM65 is therefore inhibition of Mastermind-like 1 (drosophila) (MAML1, Accession NP_055572.1), a gene which MAML1 functions as a transcriptional coactivator for Notch signaling. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAML1.

[9798] The function of MAML1 has been established by previous studies. Notch receptors (see OMIM Ref. No. NOTCH2; 600275) are involved in cell- fate determination in organisms as diverse as flies, frogs, and humans. The 'mastermind' gene has been identified in multiple genetic screens for modifiers of Notch mutations in Drosophila. Using a yeast 2- hybrid system on a HeLa cell cDNA library, Wu et al. (2000) isolated a cDNA encoding MAML1, a human homolog of Drosophila mastermind. The MAML1 gene encodes a 130- kD, 1,016- amino acid protein that localizes to nuclear bodies. MAML1 shares 24% amino acid identity and 27% amino acid similarity with Drosophila mastermind and is identical to the KIAA0200 protein reported by Nagase et al. (1996). Northern blot analysis detected a single 6- kb MAML1 transcript in all tissues tested, with an addi-

tional 1- kb transcript in placenta. MAML1 binds to the ankyrin repeat domain of all 4 mammalian Notch receptors and amplifies Notch- induced transcription of HES1 (OMIM Ref. No. 601659). These studies provided a molecular mechanism to explain the genetic links between mastermind and Notch in Drosophila and indicated that MAML1 functions as a transcriptional coactivator for Notch signaling

[9799]

[9800] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9801] Nagase, T.; Seki, N.; Ishikawa, K.; Tanaka, A.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. V. The coding sequences of 40 new genes (KIAA0161- KIAA0200) deduced by analysis of cDNA clones from human cell line KG- 1. DNA Res. 3: 17- 24, 1996. ; and

[9802] Wu, L.; Aster, J. C.; Blacklow, S. C.; Lake, R.; Artavanis-Tsakonas, S.; Griffin, J. D. : MAML1, a human homologue of Drosophila mastermind, is a transcriptional co- activator for NOTCH r.

[9803] Further studies establishing the function and utilities of

MAML1 are found in John Hopkins OMIM database record ID 605424, and in cited publications listed in Table 5, which are hereby incorporated by reference.Mitogen-activated protein kinase-activated protein kinase 3 (MAPKAPK3, Accession NP_004626.1) is another GAM65 target gene, herein designated TARGET GENE. MAPKAPK3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAPKAPK3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAPKAPK3 BINDING SITE, designated SEQ ID:16295, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9804] Another function of GAM65 is therefore inhibition of Mitogen-activated protein kinase-activated protein kinase 3 (MAPKAPK3, Accession NP_004626.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPKAPK3.

[9805] Myeloid cell leukemia sequence 1 (bcl2-related) (MCL1, Accession NP_068779.1) is another GAM65 target gene,

herein designated TARGET GENE. MCL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MCL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MCL1 BINDING SITE, designated SEQ ID:13184, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9806] Another function of GAM65 is therefore inhibition of Myeloid cell leukemia sequence 1 (bcl2-related) (MCL1, Accession NP_068779.1), a gene which involved in programing of differentiation and concomitant maintenance of viability. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCL1.

[9807] The function of MCL1 has been established by previous studies. Kozopas et al. (1993) isolated a gene, MCL1, from the ML- 1 human myeloid leukemia cell line. Expression of MCL1 increased early in the induction, or programming, of differentiation in ML- 1 (at 1- 3 hr), before the appearance of differentiation markers and mature morphology (at 1- 3 days). MCL1 showed sequence similarity, particu-

larly in the carboxyl portion, to BCL2 (OMIM Ref. No. 151430), a gene involved in normal lymphoid development and in lymphomas with the t(14;18) chromosome translocation. Further, in contrast to proliferation- associated oncogenes, the expression of MCL1 and BCL2 relates to the programming of differentiation/development and cell viability/death. Kozopas et al. (1993) suggested that MCL1 and BCL2 are 2 members of a 'new' gene family. Bae et al. (2000) identified a short splicing variant of MCL1, which they termed MCL1S. Sequence analysis indicated that the 271- amino acid variant lacks BCL2 homology domains 1 and 2 and the transmembrane domain due to the splicing out of exon 2 during mRNA processing. Unlike the full- length 350- amino acid MCL1 protein (MCL1L), yeast 2- hybrid analysis showed that MCL1S does not interact with proapoptotic BCL2 family proteins but dimerizes with the antiapoptotic MCL1L. Overexpression of MCL1S induced apoptosis in transfected CHO cells that could be antagonized by a caspase inhibitor or specifically by MCL1L. Therefore, the authors concluded that the fate of MCL1- expressing cells may be regulated through alternative splicing mechanisms and the interactions of the resulting gene products. Using the methods

of somatic cell hybrid analysis and fluorescence in situ hybridization, Craig et al. (1994) mapped MCL1 to 1q21. In the mouse, MCL1- related sequences were mapped to positions on 2 mouse chromosomes, 3 and 5, using haplotype analysis of an interspecific cross. The locus on mouse chromosome 3, Mcl1, was homologous to MCL1 on human chromosome 1; the second locus, Mcl- rs, on mouse chromosome 5, may represent a pseudogene. The proximal long arm of human chromosome 1, where MCL1 is located, is duplicated and/or rearranged in a variety of preneoplastic and neoplastic diseases, including hematologic and solid tumors. Thus, MCL1 is a candidate gene for involvement in cancer.

[9808] Animal model experiments lend further support to the function of MCL1. Rinkenberger et al. (2000) disrupted the Mcl1 locus in murine ES cells to determine the developmental roles of this Bcl2 family member. Deletion of Mcl1 resulted in periimplantation embryonic lethality. Homozygous Mcl1- deficient embryos did not implant in utero, but could be recovered at E3.5 to E4.0. Null blastocysts failed to hatch or attach in vitro, indicating a trophectoderm defect, although the inner cell mass could grow in culture. Of note, homozygous Mcl1- deficient blastocysts

showed no evidence of increased apoptosis, but exhibited a delay in maturation beyond the precompaction stage. This model indicates that Mcl1 is essential for preimplantation development and implantation, and suggests that it has a function beyond regulating apoptosis.

[9809] It is appreciated that the abovementioned animal model for MCL1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[9810] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9811] Kozopas, K. M.; Yang, T.; Buchan, H. L.; Zhou, P.; Craig, R. W. : MCL1, a gene expressed in programmed myeloid cell differentiation, has sequence similarity to BCL2. Proc. Nat. Acad. Sci. 90: 3516- 3520, 1993. ; and

[9812] Bae, J.; Leo, C. P.; Hsu, S. Y.; Hsueh, A. J. W. : MCL- 1S, a splicing variant of the antiapoptotic BCL- 2 family member MCL- 1, encodes a proapoptotic protein possessing only the BH3 domai.

[9813] Further studies establishing the function and utilities of MCL1 are found in John Hopkins OMIM database record ID 159552, and in cited publications listed in Table 5, which

are hereby incorporated by reference.MGC15937 (Accession NP_542392.2) is another GAM65 target gene, herein designated TARGET GENE. MGC15937 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC15937, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC15937 BINDING SITE, designated SEQ ID:5372, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9814] Another function of GAM65 is therefore inhibition of MGC15937 (Accession NP_542392.2) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15937.

[9815] MGC33602 (Accession NP_689604.1) is another GAM65 target gene, herein designated TARGET GENE. MGC33602 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC33602, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MGC33602 BINDING SITE, designated SEQ ID:13239, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9816] Another function of GAM65 is therefore inhibition of MGC33602 (Accession NP_689604.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33602.

[9817] MGC39518 (Accession NP_776183.1) is another GAM65 target gene, herein designated TARGET GENE. MGC39518 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC39518, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC39518 BINDING SITE, designated SEQ ID:16267, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9818] Another function of GAM65 is therefore inhibition of MGC39518 (Accession NP_776183.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC39518.

[9819] MGC4248 (Accession NP_115709.2) is another GAM65 target gene, herein designated TARGET GENE. MGC4248 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4248, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4248 BINDING SITE, designated SEQ ID:12365, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9820] Another function of GAM65 is therefore inhibition of MGC4248 (Accession NP_115709.2) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4248.

[9821] MGC955 (Accession NP_077002.1) is another GAM65 target gene, herein designated TARGET GENE. MGC955 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC955, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC955 BINDING SITE, designated SEQ ID:19343, to the nucleotide sequence of GAM65 RNA, herein designated

GAM RNA, also designated SEQ ID:272.

[9822] Another function of GAM65 is therefore inhibition of MGC955 (Accession NP_077002.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC955.

[9823] Neuralized-like (drosophila) (NEURL, Accession NP_004201.2) is another GAM65 target gene, herein designated TARGET GENE. NEURL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NEURL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NEURL BINDING SITE, designated SEQ ID:7940, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9824] Another function of GAM65 is therefore inhibition of Neuralized-like (drosophila) (NEURL, Accession NP_004201.2) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEURL.

[9825] Phosphodiesterase 4c, camp-specific (phosphodiesterase e1 dunce homolog, drosophila) (PDE4C, Accession NP_000914.1) is another GAM65 target gene, herein des-

ignated TARGET GENE. PDE4C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDE4C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDE4C BINDING SITE, designated SEQ ID:1136, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9826] Another function of GAM65 is therefore inhibition of Phosphodiesterase 4c, camp-specific (phosphodiesterase e1 dunce homolog, drosophila) (PDE4C, Accession NP_000914.1), a gene which is a cAMP- specific phosphodiesterase and may be a protein involved in learning and memory. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4C.

[9827] The function of PDE4C has been established by previous studies. Milatovich et al. (1994) applied Southern analyses of somatic cell hybrid lines and of recombinant inbred mouse strains, as well as fluorescence chromosomal in situ hybridization (FISH), to map 4 'dunce- like' cAMP-specific nucleotide phosphodiesterase genes in human and mouse. DPDE1 (also symbolized PDE4C) was assigned

to human chromosome 19 and mouse chromosome 8. DPDE2 (also symbolized PDE4A; 600126) was also assigned to human chromosome 19 but to mouse chromosome 9. DPDE3 (also symbolized PDE4D; 600129) was assigned to human 5q12 and mouse chromosome 13. DPDE4 (also symbolized PDE4B; 600127) was assigned to human 1p31 and mouse chromosome 4. By fluorescence in situ hybridization, Sullivan et al. (1999) localized the PDE4C gene to 19p13.1. They found that the PDE4C gene spans at least 38 kb, consists of at least 18 exons, and contains the marker D19S212 within an intron. Comparison of the published human PDE4C cDNA sequences with those of the genomic DNA identified 4 alternatively spliced exons and the possibility that the PDE4C locus contains at least 3 alternative promoters. The cosmids containing PDE4C also contained the genes for the growth regulatory transcription factor JUND (OMIM Ref. No. 165162), and the mini guanine nucleotide regulatory protein RAB3A (OMIM Ref. No. 179490). RAB3A was shown to consist of 5 exons spanning 7.9 kb, while the JUND gene was found to contain no introns. Analysis of cosmids containing PDE4C, JUND, and RAB3A showed that 27 kb separate JUND and PDE4C, while only 3.7 kb separate PDE4C

and RAB3A. The 3 genes share the same orientation of transcription and are arranged in the 5- prime/3- prime order as follows: JUND- - PDE4C- - RAB3A- - tel.

[9828]

[9829] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9830] Milatovich, A.; Bolger, G.; Michaeli, T.; Francke, U. : Chromosome localizations of genes for five cAMP- specific phosphodiesterases in man and mouse. Somat. Cell Molec. Genet. 20: 75- 86, 1994. ; and

[9831] Sullivan, M.; Olsen, A. S.; Houslay, M. D. : Genomic organisation of the human cyclic AMP- specific phosphodiesterase PDE4C gene and its chromosomal localisation to 19p13.1, between RAB3A.

[9832] Further studies establishing the function and utilities of PDE4C are found in John Hopkins OMIM database record ID 600128, and in cited publications listed in Table 5, which are hereby incorporated by reference.Piwi-like 2 (drosophila) (PIWIL2, Accession NP_060538.2) is another GAM65 target gene, herein designated TARGET GENE. PIWIL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PIWIL2, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIWIL2 BINDING SITE, designated SEQ ID:15554, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9833] Another function of GAM65 is therefore inhibition of Piwi-like 2 (drosophila) (PIWIL2, Accession NP_060538.2) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIWIL2.

[9834] Phospholipase c, gamma 1 (formerly subtype 148) (PLCG1, Accession NP_002651.1) is another GAM65 target gene, herein designated TARGET GENE. PLCG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLCG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLCG1 BINDING SITE, designated SEQ ID:17197, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9835] Another function of GAM65 is therefore inhibition of

Phospholipase c, gamma 1 (formerly subtype 148) (PLCG1, Accession NP_002651.1), a gene which is a major substrate for heparin- binding growth factor 1 - activated tyrosine kinase. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLCG1.

[9836] The function of PLCG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.1.Plexin a2 (PLXNA2, Accession NP_079455.1) is another GAM65 target gene, herein designated TARGET GENE. PLXNA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLXNA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLXNA2 BINDING SITE, designated SEQ ID:1002, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9837] Another function of GAM65 is therefore inhibition of Plexin a2 (PLXNA2, Accession NP_079455.1), a gene which is a transmembrane protein. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PLXNA2.

[9838] The function of PLXNA2 has been established by previous studies. In the course of searching for previously unknown genes on the human X chromosome, Maestrini et al. (1996) identified a cDNA in Xq28 encoding a transmembrane protein that they termed SEX (OMIM Ref. No. 300022). They showed that SEX shares significant homology with the extracellular domain of the receptors encoded by MET and other members of the hepatocyte growth factor (HGF) receptor family. Three other sequences closely related to SEX were identified, 1 of which (designated OCT) was shown by analysis of a panel of human/hamster somatic cell hybrids to map to chromosome 1. The proteins encoded by all 4 genes contained large cytoplasmic domains characterized by a distinctive highly conserved sequence they called the SEX domain. See also 601053 and 601055. Nomenclature: Tamagnone et al. (1999) proposed a novel nomenclature for the genes of the plexin family, which they grouped into the A, B, C, and D subfamilies; the PLXN2 gene was renamed plexin A2 by them.

[9839]

[9840] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[9841] Maestrini, E.; Tamagnone, L.; Longati, P.; Cremona, O.; Gulisano, M.; Bione, S.; Tamanini, F.; Neel, B. G.; Toniolo, D.; Comoglio, P. M. : A family of transmembrane proteins with homology to the MET- hepatocyte growth factor receptor. Proc. Nat. Acad. Sci. 93: 674- 678, 1996. ; and

[9842] Tamagnone, L.; Artigiani, S.; Chen, H.; He, Z.; Ming, G.; Song, H.; Chedotal, A.; Winberg, M. L.; Goodman, C. S.; Poo, M.; Tessier- Lavigne, M.; Comoglio, P. M. : Plexins are a large family.

[9843] Further studies establishing the function and utilities of PLXNA2 are found in John Hopkins OMIM database record ID 601054, and in cited publications listed in Table 5, which are hereby incorporated by reference.Rad21 homolog (s. pombe) (RAD21, Accession NP_006256.1) is another GAM65 target gene, herein designated TARGET GENE. RAD21 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RAD21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAD21 BINDING SITE, designated

SEQ ID:14920, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9844] Another function of GAM65 is therefore inhibition of Rad21 homolog (s. pombe) (RAD21, Accession NP_006256.1), a gene which may act in double strand break repair. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD21.

[9845] The function of RAD21 has been established by previous studies. Eukaryotic sister chromatids remain connected from the time of synthesis until they are separated in anaphase. This cohesion depends on a complex of proteins known as cohesins. In vertebrates, unlike in yeast, the cohesins dissociate from chromosome arms earlier in M phase, during prophase. Small amounts of cohesin remain near the centromere until metaphase, with complete removal at the beginning of anaphase. Cohesin complexes contain SMC1 (OMIM Ref. No. 300040), SMC3 (CSPG6; 606062), SCC1 (RAD21), and either SA1 (STAG1; 604358) or SA2 (STAG2; 604359). The complexes, in turn, interact with PDS5, a protein implicated in chromosome cohesion, condensation, and recombination in yeast (Sumara et al., 2000). By sequencing cDNAs randomly selected from a

cDNA library derived from a human immature myeloid cell line, Nomura et al. (1994) identified a cDNA encoding a homolog of S. pombe Rad21 that they termed KIAA0078. The deduced KIAA0078 protein has 631 amino acids. Northern blot analysis detected equivalent expression of KIAA0078 in all tissues tested.

[9846]

[9847] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9848] Sumara, I.; Vorlaufer, E.; Gieffers, C.; Peters, B. H.; Peters, J.- M. : Characterization of vertebrate cohesin complexes and their regulation in prophase. J. Cell Biol. 151: 749-761, 2000. ; and

[9849] Nomura, N.; Nagase, T.; Miyajima, N.; Sazuka, T.; Tanaka, A.; Sato, S.; Seki, N.; Kawarabayasi, Y.; Ishikawa, K.; Tabata, S. : Prediction of the coding sequences of unidentified human g.

[9850] Further studies establishing the function and utilities of RAD21 are found in John Hopkins OMIM database record ID 606462, and in cited publications listed in Table 5, which are hereby incorporated by reference.Rna binding motif protein 7 (RBM7, Accession NP_057174.1) is another

GAM65 target gene, herein designated TARGET GENE. RBM7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RBM7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBM7 BINDING SITE, designated SEQ ID:8355, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9851] Another function of GAM65 is therefore inhibition of Rna binding motif protein 7 (RBM7, Accession NP_057174.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM7.

[9852] Src-like-adaptor (SLA, Accession NP_006739.1) is another GAM65 target gene, herein designated TARGET GENE. SLA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLA BINDING SITE, designated SEQ ID:16487, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA,

also designated SEQ ID:272.

[9853] Another function of GAM65 is therefore inhibition of Src-like-adaptor (SLA, Accession NP_006739.1), a gene which is a negative regulator of T- cell receptor signaling. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLA.

[9854] The function of SLA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Synaptotagmin-like 4 (granuphilin-a) (SYTL4, Accession NP_542775.1) is another GAM65 target gene, herein designated TARGET GENE. SYTL4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SYTL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYTL4 BINDING SITE, designated SEQ ID:8344, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9855] Another function of GAM65 is therefore inhibition of Synaptotagmin-like 4 (granuphilin-a) (SYTL4, Accession

NP_542775.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYTL4.

[9856] sytXIV (Accession NP_694994.1) is another GAM65 target gene, herein designated TARGET GENE. sytXIV BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by sytXIV, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of sytXIV BINDING SITE, designated SEQ ID:12988, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9857] Another function of GAM65 is therefore inhibition of sytXIV (Accession NP_694994.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with sytXIV.

[9858] SZF1 (Accession NP_057173.1) is another GAM65 target gene, herein designated TARGET GENE. SZF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SZF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of SZF1 BINDING SITE, designated SEQ ID:18762, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9859] Another function of GAM65 is therefore inhibition of SZF1 (Accession NP_057173.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SZF1.

[9860] Tbc1 domain family, member 5 (TBC1D5, Accession NP_055559.1) is another GAM65 target gene, herein designated TARGET GENE. TBC1D5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TBC1D5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBC1D5 BINDING SITE, designated SEQ ID:11874, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9861] Another function of GAM65 is therefore inhibition of Tbc1 domain family, member 5 (TBC1D5, Accession NP_055559.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with TBC1D5.

[9862] Transient receptor potential cation channel, subfamily m, member 7 (TRPM7, Accession NP_060142.2) is another GAM65 target gene, herein designated TARGET GENE. TRPM7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRPM7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRPM7 BINDING SITE, designated SEQ ID:14667, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9863] Another function of GAM65 is therefore inhibition of Transient receptor potential cation channel, subfamily m, member 7 (TRPM7, Accession NP_060142.2), a gene which is a calcium channel and a protein kinase. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM7.

[9864] The function of TRPM7 has been established by previous studies. Runnels et al. (2001) demonstrated that the TRP-PLIK protein is both an ion channel and a protein kinase. TRP- PLIK displayed autophosphorylation. When ex-

pressed in CHO- K1 cells, TRP- PLIK constitutes a nonselective, calcium- permeable, 105- picosiemen, steeply outwardly rectifying conductance. The zinc finger containing the alpha- kinase domain is functional. Inactivation of the kinase activity by site- directed mutagenesis and the channel's dependence on intracellular adenosine triphosphate (ATP) demonstrated that the channel's kinase activity is essential for channel function. Nadler et al. (2001) functionally characterized LTRPC7. Targeted deletion of LTRPC7 in DT- 40 B cells was lethal, indicating that LTRPC7 has a fundamental and nonredundant role in cellular physiology. Electrophysiologic analysis of HEK293 cells overexpressing recombinant LTRPC7 showed large currents regulated by millimolar levels of intracellular magnesium- ATP and magnesium- GTP with the permeation properties of a voltage- independent divalent cation influx pathway. Analysis of several cultured cell types demonstrated small magnesium- nucleotide- regulated metal ion currents with regulation and permeation properties essentially identical to the large currents observed in cells expressing recombinant LTRPC7. Nadler et al. (2001) concluded that LTRPC7, by virtue of its sensitivity to physiologic magnesium- ATP levels, may be involved in

a fundamental process that adjusts plasma membrane divalent cation fluxes according to the metabolic state of the cell.

[9865]

[9866] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9867] Runnels, L. W.; Yue, L.; Clapham, D. E. : TRP- PLIK, a bifunctional protein with kinase and ion channel activities. Science 291: 1043- 1047, 2001. ; and

[9868] Nadler, M. J. S.; Hermosura, M. C.; Inabe, K.; Perraud, A.-L.; Zhu, Q.; Stokes, A. J.; Kurosaki, T.; Kinet, J.- P.; Penner, R.; Scharenberg, A. M.; Fleig, A. : LTRPC7 is a Mg- ATP-regulated.

[9869] Further studies establishing the function and utilities of TRPM7 are found in John Hopkins OMIM database record ID 605692, and in cited publications listed in Table 5, which are hereby incorporated by reference.Ubinuclein 1 (UBN1, Accession NP_058632.1) is another GAM65 target gene, herein designated TARGET GENE. UBN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UBN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBN1 BINDING SITE, designated SEQ ID:2743, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9870] Another function of GAM65 is therefore inhibition of Ubinuclein 1 (UBN1, Accession NP_058632.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBN1.

[9871] Vanin 1 (VNN1, Accession NP_004657.1) is another GAM65 target gene, herein designated TARGET GENE. VNN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VNN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VNN1 BINDING SITE, designated SEQ ID:19406, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9872] Another function of GAM65 is therefore inhibition of Vanin 1 (VNN1, Accession NP_004657.1), a gene which may regulate steps in thymus homing and play a role in

mammalian sexual development. Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VNN1.

[9873] The function of VNN1 has been established by previous studies. Hematopoietic precursor cells migrate to the thymus, where they differentiate into mature T lymphocytes. Aurrand- Lions et al. (1996) reported the cDNA cloning and functional analysis of mouse vanin- 1 (vascular non-inflammatory molecule- 1), a novel cell surface molecule that is involved in the thymus homing of bone marrow cells. Vanin- 1 is a glycosylphosphatidylinositol (GPI)- anchored molecule expressed by perivascular thymic stromal cells. Antibody against vanin- 1 blocked thymus colonization by hematopoietic progenitor cells in both short- and long- term assays and interfered with lymphostromal cell adhesion. The authors suggested that vanin- 1 regulates late adhesion steps of thymus homing under physiologic, noninflammatory conditions. The mammalian sex- determining pathway is controlled by the presence or absence of SRY (OMIM Ref. No. 480000) expression in the embryonic gonad. To identify additional sex- determining or gonadal differentiation genes, Grimmond et al. (2000) screened for genes exhibiting sexually dimorphic patterns

of expression in the mouse gonad at 12.5 and 13.5 days postcoitum, after overt gonad differentiation, by comparing complex cDNA probes derived from male and female gonadal tissue at these stages on microarrays constructed from a normalized urogenital ridge library. Using in situ hybridization analysis, they determined that mouse protease nexin- 1 (OMIM Ref. No. 177010) and Vnn1 exhibit male- specific expression prior to overt gonadal differentiation and are detected in the somatic portion of the developing gonad, suggesting to the authors a possible direct link to the testis- determining pathway for both genes.

[9874]

[9875] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9876] Aurrand- Lions, M.; Galland, F.; Bazin, H.; Zakharyev, V. M.; Imhof, B. A.; Naquet, P. : Vanin- 1, a novel GPI- linked perivascular molecule involved in thymus homing. Immunity 5: 391- 405, 1996. ; and

[9877] Grimmond, S.; Van Hateren, N.; Siggers, P.; Arkell, R.; Larder, R.; Soares, M. B.; de Fatima Bonaldo, M.; Smith, L.; Tymowska- Lalanne, Z.; Wells, C.; Greenfield, A. : Sexually

dimorphic ex.

[9878] Further studies establishing the function and utilities of VNN1 are found in John Hopkins OMIM database record ID 603570, and in cited publications listed in Table 5, which are hereby incorporated by reference.Vacuolar protein sorting 45a (yeast) (VPS45A, Accession NP_009190.2) is another GAM65 target gene, herein designated TARGET GENE. VPS45A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VPS45A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VPS45A BINDING SITE, designated SEQ ID:2588, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9879] Another function of GAM65 is therefore inhibition of Vacuolar protein sorting 45a (yeast) (VPS45A, Accession NP_009190.2) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS45A.

[9880] ZD52F10 (Accession NP_201574.1) is another GAM65 target gene, herein designated TARGET GENE. ZD52F10 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by ZD52F10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZD52F10 BINDING SITE, designated SEQ ID:1210, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9881] Another function of GAM65 is therefore inhibition of ZD52F10 (Accession NP_201574.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZD52F10.

[9882] ZFD25 (Accession NP_057304.1) is another GAM65 target gene, herein designated TARGET GENE. ZFD25 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZFD25, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFD25 BINDING SITE, designated SEQ ID:6103, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9883] Another function of GAM65 is therefore inhibition of ZFD25 (Accession NP_057304.1) . Accordingly, utilities of

GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFD25.

[9884] Zinc finger protein 177 (ZNF177, Accession NP_003442.1) is another GAM65 target gene, herein designated TARGET GENE. ZNF177 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF177, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF177 BINDING SITE, designated SEQ ID:16167, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9885] Another function of GAM65 is therefore inhibition of Zinc finger protein 177 (ZNF177, Accession NP_003442.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF177.

[9886] Zinc finger protein 192 (ZNF192, Accession NP_006289.1) is another GAM65 target gene, herein designated TARGET GENE. ZNF192 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF192, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF192 BINDING SITE, designated SEQ ID:1148, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9887] Another function of GAM65 is therefore inhibition of Zinc finger protein 192 (ZNF192, Accession NP_006289.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF192.

[9888] Zinc finger protein 211 (ZNF211, Accession XP_290823.1) is another GAM65 target gene, herein designated TARGET GENE. ZNF211 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZNF211, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF211 BINDING SITE, designated SEQ ID:11280, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9889] Another function of GAM65 is therefore inhibition of Zinc finger protein 211 (ZNF211, Accession XP_290823.1) . Accordingly, utilities of GAM65 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with ZNF211.

[9890] Zinc finger protein 211 (ZNF211, Accession NP_006376.1) is another GAM65 target gene, herein designated TARGET GENE. ZNF211 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ZNF211, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF211 BINDING SITE, designated SEQ ID:11280, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9891] Another function of GAM65 is therefore inhibition of Zinc finger protein 211 (ZNF211, Accession NP_006376.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF211.

[9892] Zinc finger protein 397 (ZNF397, Accession NP_115723.1) is another GAM65 target gene, herein designated TARGET GENE. ZNF397 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF397, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF397 BINDING SITE, designated SEQ ID:2348, to the nucleotide sequence of GAM65 RNA, herein designated GAM RNA, also designated SEQ ID:272.

[9893] Another function of GAM65 is therefore inhibition of Zinc finger protein 397 (ZNF397, Accession NP_115723.1) . Accordingly, utilities of GAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF397.

[9894]

[9895] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 66 (GAM66), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9896] GAM66 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM66 was detected is described hereinabove with reference to Figs. 8-15.

[9897] GAM66 gene, herein designated GAM GENE, and GAM66 target gene, herein designated TARGET GENE, are human

genes contained in the human genome.

[9898] GAM66 gene encodes a GAM66 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM66 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM66 precursor RNA is designated SEQ ID:62, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:62 is located at position 82042170 relative to chromosome 10.

[9899] GAM66 precursor RNA folds onto itself, forming GAM66 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9900] GAM66 precursor RNA folds onto itself, forming GAM66 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[9901] Nucleotide sequence of GAM66 precursor RNA, designated SEQ-ID: 62, and a schematic representation of a predicted secondary folding of GAM66 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[9902] An enzyme complex designated DICER COMPLEX, `dices` the GAM66 folded precursor RNA into GAM66 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM66 RNA is designated SEQ ID:238, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[9903] GAM66 target gene, herein designated TARGET GENE, en-

codes a corresponding messenger RNA, GAM66 target RNA, herein designated GAM TARGET RNA. GAM66 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9904] GAM66 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM66 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM66 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM66 RNA may have a different number of target binding sites in untranslated regions of a GAM66 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9905] The complementary binding of GAM66 RNA, herein designated GAM RNA, to target binding sites on GAM66 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM66 target RNA into GAM66 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9906] It is appreciated that GAM66 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM66 target genes. The mRNA of each one of this plurality of GAM66 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM66 RNA, herein designated GAM RNA, and which when bound by GAM66 RNA causes inhibition of translation of respective one or more GAM66 target proteins.

[9907] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM66 gene, herein designated GAM GENE, on one or more GAM66 target genes, herein collectively designated

TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9908] It is appreciated that specific functions and accordingly utilities of GAM66 correlate with, and may be deduced from, the identity of the target genes which GAM66 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9909]

[9910]

[9911] BOP (Accession XP_097915.2) is a GAM66 target gene, herein designated TARGET GENE. BOP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BOP, corresponding to a target binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BOP BINDING SITE, designated SEQ ID:4943, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9912] A function of GAM66 is therefore inhibition of BOP (Accession XP_097915.2) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BOP.

[9913] Chromosome 12 open reading frame 4 (C12orf4, Accession NP_065107.1) is another GAM66 target gene, herein designated TARGET GENE. C12orf4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C12orf4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C12orf4 BINDING SITE, designated SEQ ID:3404, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9914] Another function of GAM66 is therefore inhibition of Chromosome 12 open reading frame 4 (C12orf4, Acces-

sion NP_065107.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C12orf4.

[9915] Chromosome 5 open reading frame 8 (C5orf8, Accession NP_006807.1) is another GAM66 target gene, herein designated TARGET GENE. C5orf8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C5orf8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5orf8 BINDING SITE, designated SEQ ID:18156, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9916] Another function of GAM66 is therefore inhibition of Chromosome 5 open reading frame 8 (C5orf8, Accession NP_006807.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf8.

[9917] Complement component 5 receptor 1 (c5a ligand) (C5R1, Accession NP_001727.1) is another GAM66 target gene, herein designated TARGET GENE. C5R1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C5R1, corresponding to a target bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5R1 BINDING SITE, designated SEQ ID:4433, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9918] Another function of GAM66 is therefore inhibition of Complement component 5 receptor 1 (c5a ligand) (C5R1, Accession NP_001727.1), a gene which has a nonredundant function and is required for mucosal host cell defense in the lung and therefore may be associated with Asthma and pneumonia. Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of Asthma and pneumonia, and of other diseases and clinical conditions associated with C5R1.

[9919] The function of C5R1 has been established by previous studies. Using a panel of somatic cell hybrids, Bao et al. (1992) mapped the receptor for the chemotactic ligand C5a to chromosome 19. This receptor, like those for the formyl peptides (136537, 136538) and interleukin- 8 (OMIM Ref. No. 146929), is structurally related to rhodopsin (RHO; 180380) and transduces signals via intracellular GTP- binding proteins. Additionally, this recep-

tor is similar to chemokine receptor- like 1 (OMIM Ref. No. 601531). Hopken et al. (1996) deleted the murine C5a receptor (C5ar) through homologous recombination. They reported that the C5ar- deficient mice showed no developmental or biologic defects in cells in which C5a is expressed (e.g., myeloid cell lineages, hepatocytes, and epithelial cells) apart from the ability to bind and signal to exogenous C5a. Hopken et al. (1996) reported that C5ar-deficient mice bred normally and displayed no gross defects when maintained under barrier conditions. When mice were challenged with intratracheal Pseudomonas aeruginosa, the C5ar- deficient mice, in contrast to their littermates, were unable to clear the bacteria and they succumbed to pneumonia. On the basis of these studies, Hopken et al. (1996) concluded that C5ar has a nonredundant function and is required for mucosal host cell defense in the lung.

[9920]

[9921] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9922] Hopken, U. E.; Lu, D.; Gerard, N. P.; Gerard, C. : The C5a chemoattractant receptor mediates mucosal defense to

infection. Nature 383: 86- 89, 1996. ; and

[9923] Bao, L.; Gerard, N. P.; Eddy, R. L., Jr.; Shows, T. B.; Gerard, C. : Mapping of genes for the human C5a receptor (C5AR), human FMLP receptor (FPR), and two FMLP receptor homologue orphan.

[9924] Further studies establishing the function and utilities of C5R1 are found in John Hopkins OMIM database record ID 113995, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cyclin d2 (CCND2, Accession NP_001750.1) is another GAM66 target gene, herein designated TARGET GENE. CCND2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CCND2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCND2 BINDING SITE, designated SEQ ID:1190, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9925] Another function of GAM66 is therefore inhibition of Cyclin d2 (CCND2, Accession NP_001750.1), a gene which is essential for the control of the cell cycle at the g1/s (start) transition. Accordingly, utilities of GAM66 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with CCND2.

[9926] The function of CCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Crystallin, zeta (quinone reductase) (CRYZ, Accession NP_001880.2) is another GAM66 target gene, herein designated TARGET GENE. CRYZ BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CRYZ, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CRYZ BINDING SITE, designated SEQ ID:18125, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9927] Another function of GAM66 is therefore inhibition of Crystallin, zeta (quinone reductase) (CRYZ, Accession NP_001880.2), a gene which may act in the detoxification of xenobiotics. Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRYZ.

[9928] The function of CRYZ has been established by previous

studies. In addition to the alpha, beta, and gamma crystallin families, which are present in the ocular lenses of all vertebrates, a number of other crystallins have been found to be present in high amounts in lenses from phylogenetically restricted groups. Most of these 'taxon- specific' crystallins are pyridine nucleotide- dependent oxidoreductases that are also present at enzymatic levels in nonlenticular tissues. The acquisition of this new function as a lens crystallin generally occurs without gene duplication and apparently without affecting the catalytic role of the enzyme. Zeta- crystallin/quinone reductase was initially described as a major protein in the lens of the guinea pig (Huang et al., 1987), in which a mutation in the gene is associated with hereditary cataracts (Rodriguez et al., 1992). It was later found to be also present in high amounts in the lens of camels (Garland et al., 1991) and at enzymatic levels in a number of nonlenticular tissues of various species. In the lens of guinea pigs and camels, it comprises about 10% of the total soluble protein. Gonzalez et al. (1994) isolated and characterized the human zeta- crystallin gene and its processed pseudogene. The functional gene is composed of 9 exons and spans about 20 kb. The 5- prime flanking region of the gene is rich in

G and C (58%) and lacks TATA and CAAT boxes. Previous analysis of the guinea pig gene revealed the presence of 2 different promoters, one responsible for the high lens-specific expression and the other for expression at the enzymatic level in numerous tissues. A comparative analysis with the guinea pig gene showed that a region of approximately 2.5 kb that includes the promoter responsible for the high expression in the lens in the guinea pig is not present in the human gene By Southern analysis of human/mouse somatic cell hybrids, Heinzmann et al. (1994) assigned the CRYZ gene to human chromosome 1 and regionalized the assignment to 1p31- p22 by fluorescence in situ hybridization. They also identified 5 RFLPs

[9929]

[9930] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9931] Gonzalez, P.; Rao, P. V.; Zigler, J. S., Jr. : Organization of the human zeta- crystallin/quinone reductase gene (CRYZ). Genomics 21: 317- 324, 1994. ; and

[9932] Heinzmann, C.; Kojis, T. L.; Gonzalez, P.; Rao, P. V.; Zigler, J. S., Jr.; Polymeropoulos, M. H.; Klisak, I.; Sparkes, R. S.; Mohandas, T.; Bateman, J. B. : Assignment of the zeta-

crysta.

[9933] Further studies establishing the function and utilities of CRYZ are found in John Hopkins OMIM database record ID 123691, and in cited publications listed in Table 5, which are hereby incorporated by reference.Diaphanous homolog 2 (drosophila) (DIAPH2, Accession NP_006720.1) is another GAM66 target gene, herein designated TARGET GENE. DIAPH2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DIAPH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DIAPH2 BINDING SITE, designated SEQ ID:9802, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9934] Another function of GAM66 is therefore inhibition of Diaphanous homolog 2 (drosophila) (DIAPH2, Accession NP_006720.1), a gene which may affect in oogenesis and therefore may be associated with Premature ovarian failure . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of Premature ovarian failure ., and of other diseases and clinical conditions associated

with DIAPH2.

[9935] The function of DIAPH2 has been established by previous studies. Mutant alleles of Drosophila dia affect spermatogenesis or oogenesis and lead to sterility. Bione et al. (1998) characterized a human homolog of 'diaphanous' and demonstrated that this gene, designated DIA, is interrupted by a breakpoint in a patient with familial premature ovarian failure (POF; 311360). A human EST, DRES25, which showed significant homology with the Drosophila gene, was mapped to Xq22 by fluorescence in situ hybridization. Bione et al. (1998) found that the human DIA open reading frame encodes a 1,101- amino acid protein approximately 39% identical to the Drosophila protein. Northern blot analysis of human adult and fetal tissues detected 4 transcripts, 3 of which are expressed ubiquitously and the fourth exclusively in adult testis. Bione et al. (1998) showed that the DIA gene is expressed in developing ovaries and testis of the mouse, as well as in all other tissues, from the E16 stage. Banfi et al. (1997) had indicated that a human homolog of 'diaphanous' maps to Xq22. Lynch et al. (1997) noted that a nonsyndromic form of X- linked deafness, DFN2 (OMIM Ref. No. 304500), also maps to Xq22, making this homologous gene a candidate

for DFN2 hearing loss. In the family of patient BC studied by Sala et al. (1997), a balanced X;12 translocation, t(X;12)(q21;p1.3), was associated with premature ovarian failure (OMIM Ref. No. 311360). Patient BC had secondary amenorrhea, with no other associated features, at the age of 17 years. Her mother, who carried the same chromosomal rearrangement, was diagnosed with premature menopause at the age of 32 years. At diagnosis, both mother and daughter had high gonadotropin levels and inactivation of the normal X chromosome (Philippe et al., 1993). The breakpoint was mapped, by FISH, to a specific YAC. The translocation breakpoint was found to be in the last 200- kb intron of the gene.

[9936]

[9937] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9938] Bione, S.; Sala, C.; Manzini, C.; Arrigo, G.; Zuffardi, O.; Banfi, S.; Borsani, G.; Jonveaux, P.; Philippe, C.; Zuccotti, M.; Ballabio, A.; Toniolo, D. : A human homologue of the Drosophila melanogaster diaphanous gene is disrupted in a patient with premature ovarian failure: evidence for conserved function in oogenesis and implications for human

sterility. Am. J. Hum. Genet. 62: 533- 541, 1998. ; and

[9940] Further studies establishing the function and utilities of DIAPH2 are found in John Hopkins OMIM database record ID 300108, and in cited publications listed in Table 5, which are hereby incorporated by reference.DKFZp434F142 (Accession NP_115630.1) is another GAM66 target gene, herein designated TARGET GENE. DKFZp434F142 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434F142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434F142 BINDING SITE, designated SEQ ID:7547, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9941] Another function of GAM66 is therefore inhibition of DKFZp434F142 (Accession NP_115630.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with DKFZp434F142.

[9942] DKFZp434K1210 (Accession NP_060076.1) is another GAM66 target gene, herein designated TARGET GENE. DKFZp434K1210 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434K1210, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434K1210 BINDING SITE, designated SEQ ID:8684, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9943] Another function of GAM66 is therefore inhibition of DKFZp434K1210 (Accession NP_060076.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434K1210.

[9944] FLJ31322 (Accession NP_689600.1) is another GAM66 target gene, herein designated TARGET GENE. FLJ31322 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31322, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31322 BINDING SITE, designated SEQ ID:16215, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9945] Another function of GAM66 is therefore inhibition of FLJ31322 (Accession NP_689600.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31322.

[9946] FLJ32938 (Accession XP_061055.4) is another GAM66 target gene, herein designated TARGET GENE. FLJ32938 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ32938, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32938 BINDING SITE, designated SEQ ID:16646, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9947] Another function of GAM66 is therefore inhibition of FLJ32938 (Accession XP_061055.4) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32938.

[9948] FLJ34780 (Accession NP_775922.1) is another GAM66 target gene, herein designated TARGET GENE. FLJ34780 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ34780, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ34780 BINDING SITE, designated SEQ ID:6166, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9949] Another function of GAM66 is therefore inhibition of FLJ34780 (Accession NP_775922.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ34780.

[9950] FLJ37306 (Accession NP_775768.1) is another GAM66 target gene, herein designated TARGET GENE. FLJ37306 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ37306, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ37306 BINDING SITE, designated SEQ ID:5263, to the nucleotide sequence of GAM66 RNA, herein designated

GAM RNA, also designated SEQ ID:238.

[9951] Another function of GAM66 is therefore inhibition of FLJ37306 (Accession NP_775768.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ37306.

[9952] FLJ40126 (Accession NP_775870.1) is another GAM66 target gene, herein designated TARGET GENE. FLJ40126 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ40126, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ40126 BINDING SITE, designated SEQ ID:18889, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9953] Another function of GAM66 is therefore inhibition of FLJ40126 (Accession NP_775870.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ40126.

[9954] H63 (Accession NP_612432.2) is another GAM66 target gene, herein designated TARGET GENE. H63 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by H63,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of H63 BINDING SITE, designated SEQ ID:16055, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9955] Another function of GAM66 is therefore inhibition of H63 (Accession NP_612432.2) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H63.

[9956] H63 (Accession NP_816929.1) is another GAM66 target gene, herein designated TARGET GENE. H63 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by H63, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of H63 BINDING SITE, designated SEQ ID:16055, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9957] Another function of GAM66 is therefore inhibition of H63 (Accession NP_816929.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with H63.

[9958] Interleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NP_004504.3) is another GAM66 target gene, herein designated TARGET GENE. IL16 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL16 BINDING SITE, designated SEQ ID:16054, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9959] Another function of GAM66 is therefore inhibition of Interleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NP_004504.3), a gene which modulates T- cell activation. Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL16.

[9960] The function of IL16 has been established by previous studies. Cruikshank and Center (1982) reported the functional and biochemical characterization of lymphocyte chemoattractant factor, which was subsequently renamed interleukin- 16. This proinflammatory cytokine signals via

CD4, inducing chemotactic and immunomodulatory responses of CD4+ lymphocytes, monocytes, and eosinophils. Cruikshank et al. (1994) cloned a 2.2- kb IL16 cDNA, encoding a 130- amino acid protein, from a mitogen- stimulated human peripheral blood mononuclear cell cDNA library. Bannert et al. (1996) found that the cDNA isolated by Cruikshank et al. (1994) is part of a much longer open reading frame and suggested that the encoded 130- amino acid IL16 protein is derived from a large precursor protein, pro- IL16. Baier et al. (1997) cloned additional IL16 cDNAs using 5- prime RACE and reported that the deduced pro- IL16 protein has 631 amino acids and a calculated molecular mass of 67 kD. Western blot analysis detected an approximately 80- kD pro- IL16 protein in cell lysates. The authors showed that recombinant pro- IL16 proteins are specifically cleaved in lysates of CD8+ cells, resulting in a protein that is smaller than the 130- amino acid polypeptide. By Northern blot analysis, they demonstrated the expression of a major 2.6- kb IL16 transcript in lymphatic tissues

[9961]

[9962] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[9963] Bannert, N.; Baier, M.; Werner, A.; Kurth, R. : Interleukin-16 or not? Nature 381: 30 only, 1996. ; and

[9965] Further studies establishing the function and utilities of IL16 are found in John Hopkins OMIM database record ID 603035, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NP_757366.1) is another GAM66 target gene, herein designated TARGET GENE. IL16 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL16 BINDING SITE, designated SEQ ID:16054, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9966] Another function of GAM66 is therefore inhibition of In-

terleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NP_757366.1), a gene which modulates T- cell activation. Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL16.

[9967] The function of IL16 has been established by previous studies. Cruikshank and Center (1982) reported the functional and biochemical characterization of lymphocyte chemoattractant factor, which was subsequently renamed interleukin- 16. This proinflammatory cytokine signals via CD4, inducing chemotactic and immunomodulatory responses of CD4+ lymphocytes, monocytes, and eosinophils. Cruikshank et al. (1994) cloned a 2.2- kb IL16 cDNA, encoding a 130- amino acid protein, from a mitogen- stimulated human peripheral blood mononuclear cell cDNA library. Bannert et al. (1996) found that the cDNA isolated by Cruikshank et al. (1994) is part of a much longer open reading frame and suggested that the encoded 130- amino acid IL16 protein is derived from a large precursor protein, pro- IL16. Baier et al. (1997) cloned additional IL16 cDNAs using 5- prime RACE and reported that the deduced pro- IL16 protein has 631 amino acids and a calculated molecular mass of 67 kD.

Western blot analysis detected an approximately 80- kD pro- IL16 protein in cell lysates. The authors showed that recombinant pro- IL16 proteins are specifically cleaved in lysates of CD8+ cells, resulting in a protein that is smaller than the 130- amino acid polypeptide. By Northern blot analysis, they demonstrated the expression of a major 2.6- kb IL16 transcript in lymphatic tissues

[9968]

[9969] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9970] Bannert, N.; Baier, M.; Werner, A.; Kurth, R. : Interleukin-16 or not? Nature 381: 30 only, 1996. ; and

[9972] Further studies establishing the function and utilities of IL16 are found in John Hopkins OMIM database record ID 603035, and in cited publications listed in Table 5, which are hereby incorporated by reference.Internexin neuronal intermediate filament protein, alpha (INA, Accession NP_116116.1) is another GAM66 target gene, herein des-

ignated TARGET GENE. INA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by INA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of INA BINDING SITE, designated SEQ ID:7210, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9973] Another function of GAM66 is therefore inhibition of Internexin neuronal intermediate filament protein, alpha (INA, Accession NP_116116.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INA.

[9974] Potassium channel, subfamily k, member 5 (KCNK5, Accession NP_003731.1) is another GAM66 target gene, herein designated TARGET GENE. KCNK5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KCNK5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNK5 BINDING SITE, designated SEQ ID:18276, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also

designated SEQ ID:238.

[9975] Another function of GAM66 is therefore inhibition of Potassium channel, subfamily k, member 5 (KCNK5, Accession NP_003731.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK5.

[9976] KIAA0252 (Accession NP_055953.1) is another GAM66 target gene, herein designated TARGET GENE. KIAA0252 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0252, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0252 BINDING SITE, designated SEQ ID:14205, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9977] Another function of GAM66 is therefore inhibition of KIAA0252 (Accession NP_055953.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0252.

[9978] KIAA0976 (Accession NP_055732.1) is another GAM66 target gene, herein designated TARGET GENE. KIAA0976

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0976, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0976 BINDING SITE, designated SEQ ID:19828, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9979] Another function of GAM66 is therefore inhibition of KIAA0976 (Accession NP_055732.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0976.

[9980] KIAA1128 (Accession NP_061872.1) is another GAM66 target gene, herein designated TARGET GENE. KIAA1128 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1128, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1128 BINDING SITE, designated SEQ ID:7548, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9981] Another function of GAM66 is therefore inhibition of KIAA1128 (Accession NP_061872.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1128.

[9982] KIAA1327 (Accession XP_051146.2) is another GAM66 target gene, herein designated TARGET GENE. KIAA1327 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1327, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1327 BINDING SITE, designated SEQ ID:7254, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9983] Another function of GAM66 is therefore inhibition of KIAA1327 (Accession XP_051146.2) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1327.

[9984] KIAA1577 (Accession XP_035299.1) is another GAM66 target gene, herein designated TARGET GENE. KIAA1577 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by KIAA1577, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1577 BINDING SITE, designated SEQ ID:9184, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9985] Another function of GAM66 is therefore inhibition of KIAA1577 (Accession XP_035299.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1577.

[9986] KIAA1618 (Accession XP_290769.2) is another GAM66 target gene, herein designated TARGET GENE. KIAA1618 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1618, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1618 BINDING SITE, designated SEQ ID:6857, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9987] Another function of GAM66 is therefore inhibition of

KIAA1618 (Accession XP_290769.2) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1618.

[9988] KIAA1872 (Accession NP_149053.1) is another GAM66 target gene, herein designated TARGET GENE. KIAA1872 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1872, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1872 BINDING SITE, designated SEQ ID:15500, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9989] Another function of GAM66 is therefore inhibition of KIAA1872 (Accession NP_149053.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1872.

[9990] Leukemia inhibitory factor (cholinergic differentiation factor) (LIF, Accession NP_002300.1) is another GAM66 target gene, herein designated TARGET GENE. LIF BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by LIF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LIF BINDING SITE, designated SEQ ID:4319, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9991] Another function of GAM66 is therefore inhibition of Leukemia inhibitory factor (cholinergic differentiation factor) (LIF, Accession NP_002300.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIF.

[9992] LOC114971 (Accession XP_054936.4) is another GAM66 target gene, herein designated TARGET GENE. LOC114971 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC114971, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC114971 BINDING SITE, designated SEQ ID:2099, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9993] Another function of GAM66 is therefore inhibition of

LOC114971 (Accession XP_054936.4) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114971.

[9994] LOC145231 (Accession XP_096740.1) is another GAM66 target gene, herein designated TARGET GENE. LOC145231 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145231, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145231 BINDING SITE, designated SEQ ID:10362, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9995] Another function of GAM66 is therefore inhibition of LOC145231 (Accession XP_096740.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145231.

[9996] LOC146227 (Accession XP_085374.2) is another GAM66 target gene, herein designated TARGET GENE. LOC146227 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146227, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146227 BINDING SITE, designated SEQ ID:5104, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9997] Another function of GAM66 is therefore inhibition of LOC146227 (Accession XP_085374.2) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146227.

[9998] LOC146481 (Accession XP_085484.2) is another GAM66 target gene, herein designated TARGET GENE. LOC146481 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146481, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146481 BINDING SITE, designated SEQ ID:9334, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[9999] Another function of GAM66 is therefore inhibition of LOC146481 (Accession XP_085484.2) . Accordingly, utili-

ties of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146481.

[10000] LOC150212 (Accession XP_086827.2) is another GAM66 target gene, herein designated TARGET GENE. LOC150212 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150212, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150212 BINDING SITE, designated SEQ ID:14049, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10001] Another function of GAM66 is therefore inhibition of LOC150212 (Accession XP_086827.2) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150212.

[10002] LOC154860 (Accession XP_098623.1) is another GAM66 target gene, herein designated TARGET GENE. LOC154860 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC154860, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154860 BINDING SITE, designated SEQ ID:9864, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10003] Another function of GAM66 is therefore inhibition of LOC154860 (Accession XP_098623.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154860.

[10004] LOC154990 (Accession XP_088109.3) is another GAM66 target gene, herein designated TARGET GENE. LOC154990 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC154990, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154990 BINDING SITE, designated SEQ ID:4166, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10005] Another function of GAM66 is therefore inhibition of LOC154990 (Accession XP_088109.3) . Accordingly, utilities of GAM66 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC154990.

[10006] LOC164714 (Accession XP_104657.1) is another GAM66 target gene, herein designated TARGET GENE. LOC164714 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC164714, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC164714 BINDING SITE, designated SEQ ID:13234, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10007] Another function of GAM66 is therefore inhibition of LOC164714 (Accession XP_104657.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164714.

[10008] LOC222057 (Accession XP_166594.2) is another GAM66 target gene, herein designated TARGET GENE. LOC222057 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC222057, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC222057 BINDING SITE, designated SEQ ID:10021, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10009] Another function of GAM66 is therefore inhibition of LOC222057 (Accession XP_166594.2) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222057.

[10010] LOC283048 (Accession XP_210867.1) is another GAM66 target gene, herein designated TARGET GENE. LOC283048 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283048, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283048 BINDING SITE, designated SEQ ID:15529, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10011] Another function of GAM66 is therefore inhibition of LOC283048 (Accession XP_210867.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC283048.

[10012] LOC283216 (Accession XP_210939.1) is another GAM66 target gene, herein designated TARGET GENE. LOC283216 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283216, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283216 BINDING SITE, designated SEQ ID:20167, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10013] Another function of GAM66 is therefore inhibition of LOC283216 (Accession XP_210939.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283216.

[10014] LOC283323 (Accession XP_210973.1) is another GAM66 target gene, herein designated TARGET GENE. LOC283323 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283323, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC283323 BINDING SITE, designated SEQ ID:1999, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10015] Another function of GAM66 is therefore inhibition of LOC283323 (Accession XP_210973.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283323.

[10016] LOC283657 (Accession XP_211148.1) is another GAM66 target gene, herein designated TARGET GENE. LOC283657 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283657, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283657 BINDING SITE, designated SEQ ID:19902, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10017] Another function of GAM66 is therefore inhibition of LOC283657 (Accession XP_211148.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283657.

[10018] LOC284080 (Accession XP_211322.1) is another GAM66 target gene, herein designated TARGET GENE. LOC284080 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284080, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284080 BINDING SITE, designated SEQ ID:6336, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10019] Another function of GAM66 is therefore inhibition of LOC284080 (Accession XP_211322.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284080.

[10020] LOC284117 (Accession XP_209024.1) is another GAM66 target gene, herein designated TARGET GENE. LOC284117 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284117, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284117 BINDING SITE, designated SEQ ID:13823, to

the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10021] Another function of GAM66 is therefore inhibition of LOC284117 (Accession XP_209024.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284117.

[10022] LOC285136 (Accession XP_211777.1) is another GAM66 target gene, herein designated TARGET GENE. LOC285136 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285136, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285136 BINDING SITE, designated SEQ ID:3059, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10023] Another function of GAM66 is therefore inhibition of LOC285136 (Accession XP_211777.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285136.

[10024] LOC285369 (Accession XP_211861.3) is another GAM66

target gene, herein designated TARGET GENE. LOC285369 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285369, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285369 BINDING SITE, designated SEQ ID:11869, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10025] Another function of GAM66 is therefore inhibition of LOC285369 (Accession XP_211861.3) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285369.

[10026] LOC285387 (Accession XP_209588.1) is another GAM66 target gene, herein designated TARGET GENE. LOC285387 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285387, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285387 BINDING SITE, designated SEQ ID:18757, to the nucleotide sequence of GAM66 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:238.

[10027] Another function of GAM66 is therefore inhibition of LOC285387 (Accession XP_209588.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285387.

[10028] LOC286058 (Accession XP_212158.1) is another GAM66 target gene, herein designated TARGET GENE. LOC286058 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286058, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286058 BINDING SITE, designated SEQ ID:16079, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10029] Another function of GAM66 is therefore inhibition of LOC286058 (Accession XP_212158.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286058.

[10030] LOC286149 (Accession XP_212202.1) is another GAM66 target gene, herein designated TARGET GENE. LOC286149

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286149, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286149 BINDING SITE, designated SEQ ID:18656, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10031] Another function of GAM66 is therefore inhibition of LOC286149 (Accession XP_212202.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286149.

[10032] LOC339439 (Accession XP_294952.2) is another GAM66 target gene, herein designated TARGET GENE. LOC339439 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339439, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339439 BINDING SITE, designated SEQ ID:10021, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10033] Another function of GAM66 is therefore inhibition of LOC339439 (Accession XP_294952.2) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339439.

[10034] LOC340128 (Accession XP_295164.2) is another GAM66 target gene, herein designated TARGET GENE. LOC340128 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340128, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340128 BINDING SITE, designated SEQ ID:10021, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10035] Another function of GAM66 is therefore inhibition of LOC340128 (Accession XP_295164.2) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340128.

[10036] LOC340346 (Accession XP_295213.2) is another GAM66 target gene, herein designated TARGET GENE. LOC340346 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC340346, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340346 BINDING SITE, designated SEQ ID:10021, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10037] Another function of GAM66 is therefore inhibition of LOC340346 (Accession XP_295213.2) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340346.

[10038] LOC347648 (Accession XP_300226.1) is another GAM66 target gene, herein designated TARGET GENE. LOC347648 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC347648, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347648 BINDING SITE, designated SEQ ID:5082, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10039] Another function of GAM66 is therefore inhibition of

LOC347648 (Accession XP_300226.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347648.

[10040] LOC348301 (Accession XP_302717.1) is another GAM66 target gene, herein designated TARGET GENE. LOC348301 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348301, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348301 BINDING SITE, designated SEQ ID:866, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10041] Another function of GAM66 is therefore inhibition of LOC348301 (Accession XP_302717.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348301.

[10042] LOC348450 (Accession XP_302758.1) is another GAM66 target gene, herein designated TARGET GENE. LOC348450 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348450, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348450 BINDING SITE, designated SEQ ID:4166, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10043] Another function of GAM66 is therefore inhibition of LOC348450 (Accession XP_302758.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348450.

[10044] LOC348508 (Accession XP_302806.1) is another GAM66 target gene, herein designated TARGET GENE. LOC348508 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348508, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348508 BINDING SITE, designated SEQ ID:10021, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10045] Another function of GAM66 is therefore inhibition of LOC348508 (Accession XP_302806.1) . Accordingly, utili-

ties of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348508.

[10046] LOC348529 (Accession XP_302813.1) is another GAM66 target gene, herein designated TARGET GENE. LOC348529 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348529, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348529 BINDING SITE, designated SEQ ID:6460, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10047] Another function of GAM66 is therefore inhibition of LOC348529 (Accession XP_302813.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348529.

[10048] LOC348842 (Accession XP_300861.1) is another GAM66 target gene, herein designated TARGET GENE. LOC348842 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348842, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348842 BINDING SITE, designated SEQ ID:4166, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10049] Another function of GAM66 is therefore inhibition of LOC348842 (Accession XP_300861.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348842.

[10050] LOC349071 (Accession XP_300933.1) is another GAM66 target gene, herein designated TARGET GENE. LOC349071 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349071, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349071 BINDING SITE, designated SEQ ID:10021, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10051] Another function of GAM66 is therefore inhibition of LOC349071 (Accession XP_300933.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC349071.

[10052] LOC349275 (Accession XP_302588.1) is another GAM66 target gene, herein designated TARGET GENE. LOC349275 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349275, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349275 BINDING SITE, designated SEQ ID:7680, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10053] Another function of GAM66 is therefore inhibition of LOC349275 (Accession XP_302588.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349275.

[10054] LOC349297 (Accession XP_302589.1) is another GAM66 target gene, herein designated TARGET GENE. LOC349297 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349297, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC349297 BINDING SITE, designated SEQ ID:7680, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10055] Another function of GAM66 is therefore inhibition of LOC349297 (Accession XP_302589.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349297.

[10056] LOC349419 (Accession XP_291356.1) is another GAM66 target gene, herein designated TARGET GENE. LOC349419 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349419, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349419 BINDING SITE, designated SEQ ID:17974, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10057] Another function of GAM66 is therefore inhibition of LOC349419 (Accession XP_291356.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC349419.

[10058] LOC90520 (Accession XP_032277.1) is another GAM66 target gene, herein designated TARGET GENE. LOC90520 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90520, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90520 BINDING SITE, designated SEQ ID:19060, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10059] Another function of GAM66 is therefore inhibition of LOC90520 (Accession XP_032277.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90520.

[10060] LOC92597 (Accession NP_775739.1) is another GAM66 target gene, herein designated TARGET GENE. LOC92597 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92597, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC92597 BINDING SITE, designated SEQ ID:14239, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10061] Another function of GAM66 is therefore inhibition of LOC92597 (Accession NP_775739.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92597.

[10062] MGC16664 (Accession NP_775780.1) is another GAM66 target gene, herein designated TARGET GENE. MGC16664 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC16664, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC16664 BINDING SITE, designated SEQ ID:3795, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10063] Another function of GAM66 is therefore inhibition of MGC16664 (Accession NP_775780.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16664.

[10064] MGC20255 (Accession NP_443080.1) is another GAM66 target gene, herein designated TARGET GENE. MGC20255 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC20255, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC20255 BINDING SITE, designated SEQ ID:8679, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10065] Another function of GAM66 is therefore inhibition of MGC20255 (Accession NP_443080.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20255.

[10066] MGC4643 (Accession NP_116104.1) is another GAM66 target gene, herein designated TARGET GENE. MGC4643 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4643, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4643 BINDING SITE, designated SEQ ID:3909, to the

nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10067] Another function of GAM66 is therefore inhibition of MGC4643 (Accession NP_116104.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4643.

[10068] Phosphatidylinositol glycan, class s (PIGS, Accession NP_149975.1) is another GAM66 target gene, herein designated TARGET GENE. PIGS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PIGS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIGS BINDING SITE, designated SEQ ID:3985, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10069] Another function of GAM66 is therefore inhibition of Phosphatidylinositol glycan, class s (PIGS, Accession NP_149975.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGS.

[10070] PRO1853 (Accession NP_061077.1) is another GAM66 target gene, herein designated TARGET GENE. PRO1853

BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PRO1853, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO1853 BINDING SITE, designated SEQ ID:15239, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10071] Another function of GAM66 is therefore inhibition of PRO1853 (Accession NP_061077.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1853.

[10072] Rad50 homolog (s. cerevisiae) (RAD50, Accession NP_005723.2) is another GAM66 target gene, herein designated TARGET GENE. RAD50 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RAD50, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAD50 BINDING SITE, designated SEQ ID:11752, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10073] Another function of GAM66 is therefore inhibition of Rad50 homolog (s. cerevisiae) (RAD50, Accession NP_005723.2), a gene which is involved in dna double-strand break repair (dsbr). and therefore may be associated with Myeloid leukemia and breast cancer. Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of Myeloid leukemia and breast cancer, and of other diseases and clinical conditions associated with RAD50.

[10074] The function of RAD50 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM34.1.Rad50 homolog (s. cerevisiae) (RAD50, Accession NP_597816.1) is another GAM66 target gene, herein designated TARGET GENE. RAD50 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RAD50, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAD50 BINDING SITE, designated SEQ ID:11752, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10075] Another function of GAM66 is therefore inhibition of Rad50 homolog (s. cerevisiae) (RAD50, Accession NP_597816.1), a gene which is involved in dna double-strand break repair (dsbr). and therefore may be associated with Myeloid leukemia and breast cancer. Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of Myeloid leukemia and breast cancer, and of other diseases and clinical conditions associated with RAD50.

[10076] The function of RAD50 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM34.1.Ryanodine receptor 2 (cardiac) (RYR2, Accession NP_001026.1) is another GAM66 target gene, herein designated TARGET GENE. RYR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RYR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RYR2 BINDING SITE, designated SEQ ID:12550, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10077] Another function of GAM66 is therefore inhibition of

Ryanodine receptor 2 (cardiac) (RYR2, Accession NP_001026.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RYR2.

[10078] SETDB2 (Accession NP_114121.1) is another GAM66 target gene, herein designated TARGET GENE. SETDB2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SETDB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SETDB2 BINDING SITE, designated SEQ ID:10049, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10079] Another function of GAM66 is therefore inhibition of SETDB2 (Accession NP_114121.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SETDB2.

[10080] Solute carrier family 19 (folate transporter), member 1 (SLC19A1, Accession NP_003047.1) is another GAM66 target gene, herein designated TARGET GENE. SLC19A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC19A1, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC19A1 BINDING SITE, designated SEQ ID:3271, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10081] Another function of GAM66 is therefore inhibition of Solute carrier family 19 (folate transporter), member 1 (SLC19A1, Accession NP_003047.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC19A1.

[10082] Smcy homolog, y chromosome (mouse) (SMCY, Accession NP_004644.1) is another GAM66 target gene, herein designated TARGET GENE. SMCY BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SMCY, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMCY BINDING SITE, designated SEQ ID:10886, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10083] Another function of GAM66 is therefore inhibition of Smcy homolog, y chromosome (mouse) (SMCY, Accession

NP_004644.1), a gene which plays a role in spermatogenesis. Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCY.

[10084] The function of SMCY has been established by previous studies., Burgoyne et al. (1986) suggested that the H- Y antigen gene or a gene closely linked to it plays a role in spermatogenesis. Simpson et al. (1993) found that of 9 azoospermic or severely oligospermic patients 7 could be tested for HYA expression; of these, 6 were H- Y positive. Of 3 patients showing Yq structural abnormalities, 2 could be tested for H- Y expression; 1 was negative, the other positive. These results showed no correlation between spermatogenic failure and the absence of HYA, thus separating the AZF locus (OMIM Ref. No. 415000) from HYA. Agulnik et al. (1994) described the isolation of a gene that mapped to the short arm of the mouse Y chromosome. They called the gene Smcy for 'selected mouse cDNA on Y.' It was clustered with the Ube1y (OMIM Ref. No. 489000) and the Zfy1 genes (OMIM Ref. No. 490000) in a segment of approximately 250 kb. A homologous gene, Smcx (OMIM Ref. No. 314690), was found on the X chromosome. Expression of Smcy was detected in all male tis-

sues and expression of Smcx in all male and female tissues tested. Remarkably, the expression of both genes was detected in pools of mouse preimplantation embryos as early as the 2- cell stage. They found that Smcy, like Sry (OMIM Ref. No. 480000) and Ube1y, has been conserved on the Y chromosome since the divergence of metatherian and eutherian mammals some 120 million years ago. Agulnik et al. (1994) isolated homologous genes from the human and horse and showed that they have similar exon/intron organizations and are more than 93% similar to each other and to Smcx at the amino acid level. Using a set of overlapping YAC clones provided by David Page, Agulnik et al. (1994) determined that the human SMCY gene maps to deletion interval 5O/5P on Yq between STS markers DYS214 and DYS215. The HYA locus maps to the same interval on the human Y chromosome. In an accompanying paper, Agulnik et al. (1994) also showed that the X chromosome gene (SMCX) escapes X-inactivation in both mouse and human.

[10085]

[10086] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10087] Simpson, E.; Chandler, P.; Goulmy, E.; Ma, K.; Hargreave, T. B.; Chandley, A. C. : Loss of the 'azoospermia factor' (AZF) on Yq in man is not associated with loss of HYA. Hum. Molec. Genet. 2: 469- 471, 1993. ; and

[10088] Agulnik, A. I.; Mitchell, M. J.; Lerner, J. L.; Woods, D. R.; Bishop, C. E. : A mouse Y chromosome gene encoded by a region essential for spermatogenesis and expression of male- specific min.

[10089] Further studies establishing the function and utilities of SMCY are found in John Hopkins OMIM database record ID 426000, and in cited publications listed in Table 5, which are hereby incorporated by reference.Suppression of tumorigenicity 5 (ST5, Accession NP_005409.2) is another GAM66 target gene, herein designated TARGET GENE. ST5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ST5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ST5 BINDING SITE, designated SEQ ID:18268, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10090] Another function of GAM66 is therefore inhibition of Sup-

pression of tumorigenicity 5 (ST5, Accession NP_005409.2), a gene which preferentially binds to the SH3 domain of c- Abl kinase, and acts as a regulator of MAPK1/ERK2 kinase. Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST5.

[10091] The function of ST5 has been established by previous studies. The tumorigenicity of HeLa cells in nude mice can be suppressed by the addition of a normal human chromosome 11 in somatic cell hybrids (Stanbridge, 1976; Klinger, 1980); see 191181 for description of a tumor-suppressor gene located on 11q. Lichy et al. (1992) isolated a HeLa cell line that displayed morphologic features of the nontumorigenic hybrids, demonstrated reduced tumorigenicity in nude mice, and showed an 85% reduction in alkaline phosphatase, a consistent marker of the tumorigenic phenotype in these cells. This cell line, designated F2, contained a single exogenous cDNA, which was recovered by polymerase chain reaction (PCR) and designated HTS1 because of its probable association with 'HeLa tumor suppression.' In nontumorigenic hybrids, RNA species of 2.8, 3.1, and 4.6 kb were identified. In 2 tumorigenic hybrid lines, the 2.8- kb species was markedly

reduced or absent. Whereas 3 nontumorigenic human keratinocyte lines expressed all 3 RNA species, several tumorigenic cervical carcinoma cell lines lacked the 2.8- kb species. The HTS1 gene was localized to 11p15 by in situ hybridization, confirming the assignment to chromosome 11 by somatic cell hybrid analysis. Lichy et al. (1992) reviewed previous evidence indicating the presence of a tumor suppressor gene in the 11p15 region; see 194071 and 185440.

[10092]

[10093] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10094] Lichy, J. H.; Modi, W. S.; Seuanez, H. N.; Howley, P. M. : Identification of a human chromosome 11 gene which is differentially regulated in tumorigenic and nontumorigenic somatic cell hybrids of HeLa cells. Cell Growth Differ. 3: 541- 548, 1992. ; and

[10095] Stanbridge, E. J. : Suppression of malignancy in human cells. Nature 260: 17- 20, 1976.

[10096] Further studies establishing the function and utilities of ST5 are found in John Hopkins OMIM database record ID 140750, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Suppression of tumorigenicity 5 (ST5, Accession NP_631896.1) is another GAM66 target gene, herein designated TARGET GENE. ST5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ST5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ST5 BINDING SITE, designated SEQ ID:18268, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10097] Another function of GAM66 is therefore inhibition of Suppression of tumorigenicity 5 (ST5, Accession NP_631896.1), a gene which preferentially binds to the SH3 domain of c- Abl kinase, and acts as a regulator of MAPK1/ERK2 kinase. Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST5.

[10098] The function of ST5 has been established by previous studies. The tumorigenicity of HeLa cells in nude mice can be suppressed by the addition of a normal human chromosome 11 in somatic cell hybrids (Stanbridge, 1976; Klinger, 1980); see 191181 for description of a tumor-

suppressor gene located on 11q. Lichy et al. (1992) isolated a HeLa cell line that displayed morphologic features of the nontumorigenic hybrids, demonstrated reduced tumorigenicity in nude mice, and showed an 85% reduction in alkaline phosphatase, a consistent marker of the tumorigenic phenotype in these cells. This cell line, designated F2, contained a single exogenous cDNA, which was recovered by polymerase chain reaction (PCR) and designated HTS1 because of its probable association with 'HeLa tumor suppression.' In nontumorigenic hybrids, RNA species of 2.8, 3.1, and 4.6 kb were identified. In 2 tumorigenic hybrid lines, the 2.8- kb species was markedly reduced or absent. Whereas 3 nontumorigenic human keratinocyte lines expressed all 3 RNA species, several tumorigenic cervical carcinoma cell lines lacked the 2.8- kb species. The HTS1 gene was localized to 11p15 by in situ hybridization, confirming the assignment to chromosome 11 by somatic cell hybrid analysis. Lichy et al. (1992) reviewed previous evidence indicating the presence of a tumor suppressor gene in the 11p15 region; see 194071 and 185440.

[10100] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[10101] Lichy, J. H.; Modi, W. S.; Seuanez, H. N.; Howley, P. M. : Identification of a human chromosome 11 gene which is differentially regulated in tumorigenic and nontumorigenic somatic cell hybrids of HeLa cells. Cell Growth Differ. 3: 541- 548, 1992. ; and

[10102] Stanbridge, E. J. : Suppression of malignancy in human cells. Nature 260: 17- 20, 1976.

[10103] Further studies establishing the function and utilities of ST5 are found in John Hopkins OMIM database record ID 140750, and in cited publications listed in Table 5, which are hereby incorporated by reference.Stromal antigen 2 (STAG2, Accession NP_006594.3) is another GAM66 target gene, herein designated TARGET GENE. STAG2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STAG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STAG2 BINDING SITE, designated SEQ ID:11828, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10104] Another function of GAM66 is therefore inhibition of Stromal antigen 2 (STAG2, Accession NP_006594.3) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAG2.

[10105] Striatin, calmodulin binding protein 3 (STRN3, Accession NP_055389.1) is another GAM66 target gene, herein designated TARGET GENE. STRN3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STRN3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STRN3 BINDING SITE, designated SEQ ID:14812, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10106] Another function of GAM66 is therefore inhibition of Striatin, calmodulin binding protein 3 (STRN3, Accession NP_055389.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRN3.

[10107] Tyrosinase-related protein 1 (TYRP1, Accession NP_000541.1) is another GAM66 target gene, herein designated TARGET GENE. TYRP1 BINDING SITE is a target

binding site found in the 3` untranslated region of mRNA encoded by TYRP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TYRP1 BINDING SITE, designated SEQ ID:14058, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10108] Another function of GAM66 is therefore inhibition of Tyrosinase-related protein 1 (TYRP1, Accession NP_000541.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TYRP1.

[10109] Ubiquitin associated protein 1 (UBAP1, Accession NP_057609.2) is another GAM66 target gene, herein designated TARGET GENE. UBAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UBAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBAP1 BINDING SITE, designated SEQ ID:14677, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10110] Another function of GAM66 is therefore inhibition of

Ubiquitin associated protein 1 (UBAP1, Accession NP_057609.2) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBAP1.

[10111] XT3 (Accession NP_071800.1) is another GAM66 target gene, herein designated TARGET GENE. XT3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by XT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of XT3 BINDING SITE, designated SEQ ID:9880, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10112] Another function of GAM66 is therefore inhibition of XT3 (Accession NP_071800.1), a gene which is a Kidney- specific orphan transporter. Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XT3.

[10113] The function of XT3 has been established by previous studies. Na(+) and Cl(-)- coupled transporter proteins mediate transit of structurally related small hydrophilic substances across plasma membranes. These transporters

are structurally related to a small subgroup of proteins with no known substrates. By screening a mouse kidney cDNA library, Nash et al. (1998) obtained cDNAs encoding 2 members of this subgroup, Xt2 and Xt3. Using mouse Xt3 to screen a human kidney cDNA library, they obtained a partial sequence encoding human XT3. Sequence analysis predicted that the mouse sequence, approximately 88% identical to human XT3 and rat B21a, contains 12 potential transmembrane domains. Northern blot analysis detected 3.2- and 4.0- kb XT3 transcripts in human kidney and small intestine, with no expression detected in other tissues. Expression was slightly higher in kidney, where an 8.5- kb transcript was also detected. Immunofluorescence microscopy demonstrated expression on the plasma membrane of transfected cells. Nash et al. (1998) tested numerous substrates but failed to identify a compound transported by Xt3. Nash et al. (1998) mapped the mouse Xt3 gene to chromosome 9, near the telomere. Scott (2001) mapped the human XT3 gene to chromosome 3 based on sequence similarity between the XT3 sequence (GenBank AF075260) and a chromosome 3 clone (GenBank AC005669).

[10114]

[10115] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10116] Nash, S. R.; Giros, B.; Kingsmore, S. F.; Kim, K. M.; El-Mestikawy, S.; Dong, Q.; Fumagalli, F.; Seldin, M. F.; Caron, M. Scott (2001) mapped the human XT3 gene to chromosome 3 based on sequence similarity between the XT3 sequence (GenBank AF075260) and a chromosome 3 clone (GenBank AC005669).

[10121]

[10122] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10123] Nash, S. R.; Giros, B.; Kingsmore, S. F.; Kim, K. M.; El-Mestikawy, S.; Dong, Q.; Fumagalli, F.; Seldin, M. F.; Caron, M. G. : Cloning, gene structure and genomic localization of an orphan transporter from mouse kidney with six alternatively- spliced isoforms. Receptors Channels 6: 113- 128, 1998. ; and

[10124] Scott, A. F. : Personal Communication. Baltimore, Md., 2/5/2001.

[10125] Further studies establishing the function and utilities of

XT3 are found in John Hopkins OMIM database record ID 605616, and in cited publications listed in Table 5, which are hereby incorporated by reference.Zinc finger protein 313 (ZNF313, Accession NP_061153.1) is another GAM66 target gene, herein designated TARGET GENE. ZNF313 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZNF313, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF313 BINDING SITE, designated SEQ ID:8054, to the nucleotide sequence of GAM66 RNA, herein designated GAM RNA, also designated SEQ ID:238.

[10126] Another function of GAM66 is therefore inhibition of Zinc finger protein 313 (ZNF313, Accession NP_061153.1) . Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF313.

[10127]

[10128] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 67 (GAM67), which modulates expression of respective target

genes thereof, the function and utility of which target genes is known in the art.

[10129] GAM67 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM67 was detected is described hereinabove with reference to Figs. 8-15.

[10130] GAM67 gene, herein designated GAM GENE, and GAM67 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[10131] GAM67 gene encodes a GAM67 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM67 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM67 precursor RNA is designated SEQ ID:37, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:37 is located at position 38369449 relative to chromosome 17.

[10132] GAM67 precursor RNA folds onto itself, forming GAM67 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10133] GAM67 precursor RNA folds onto itself, forming GAM67 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[10134] Nucleotide sequence of GAM67 precursor RNA, designated SEQ-ID: 37, and a schematic representation of a predicted secondary folding of GAM67 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[10135] An enzyme complex designated DICER COMPLEX, `dices` the GAM67 folded precursor RNA into GAM67 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA

segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM67 RNA is designated SEQ ID:282, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[10136] GAM67 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM67 target RNA, herein designated GAM TARGET RNA. GAM67 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10137] GAM67 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM67 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM67 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING

SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM67 RNA may have a different number of target binding sites in untranslated regions of a GAM67 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10138] The complementary binding of GAM67 RNA, herein designated GAM RNA, to target binding sites on GAM67 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM67 target RNA into GAM67 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10139] It is appreciated that GAM67 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM67 target genes. The mRNA of each one of this plurality of GAM67 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM67 RNA,

herein designated GAM RNA, and which when bound by GAM67 RNA causes inhibition of translation of respective one or more GAM67 target proteins.

[10140] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM67 gene, herein designated GAM GENE, on one or more GAM67 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10141] It is appreciated that specific functions and accordingly utilities of GAM67 correlate with, and may be deduced from, the identity of the target genes which GAM67 binds and inhibits, and the function of these target genes, as

elaborated hereinbelow.

[10142]

[10143]

[10144] Amyotrophic lateral sclerosis 2 (juvenile) (ALS2, Accession NP_065970.1) is a GAM67 target gene, herein designated TARGET GENE. ALS2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ALS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALS2 BINDING SITE, designated SEQ ID:12702, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10145] A function of GAM67 is therefore inhibition of Amyotrophic lateral sclerosis 2 (juvenile) (ALS2, Accession NP_065970.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALS2.

[10146] Adenomatosis polyposis coli (APC, Accession NP_000029.1) is another GAM67 target gene, herein designated TARGET GENE. APC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA en-

coded by APC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APC BINDING SITE, designated SEQ ID:10697, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10147] Another function of GAM67 is therefore inhibition of Adenomatosis polyposis coli (APC, Accession NP_000029.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APC.

[10148] Rho gtpase activating protein 8 (ARHGAP8, Accession NP_060171.2) is another GAM67 target gene, herein designated TARGET GENE. ARHGAP8 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ARHGAP8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGAP8 BINDING SITE, designated SEQ ID:12147, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10149] Another function of GAM67 is therefore inhibition of Rho

gtpase activating protein 8 (ARHGAP8, Accession NP_060171.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP8.

[10150] Aryl-hydrocarbon receptor nuclear translocator 2 (ARNT2, Accession NP_055677.1) is another GAM67 target gene, herein designated TARGET GENE. ARNT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARNT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARNT2 BINDING SITE, designated SEQ ID:19883, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10151] Another function of GAM67 is therefore inhibition of Aryl-hydrocarbon receptor nuclear translocator 2 (ARNT2, Accession NP_055677.1), a gene which specifically recognizes the xenobiotic response element (xre). Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNT2.

[10152] The function of ARNT2 has been established by previous

studies. Hirose et al. (1996) determined that Arnt2 interacts with mouse AhR and Sim as efficiently as Arnt and that the Arnt2- AhR complex recognizes and specifically binds the xenobiotic responsive element (XRE) sequence. In DNA transfection experiments, Arnt2 rescued XRE-driven reporter gene activity in Arnt mutant cells. RNA blot analysis detected restricted expression of Arnt2 in the brains and kidneys of adult mice, in contrast to the ubiquitous expression of Arnt. In situ hybridization experiments demonstrated expression of Arnt2 exclusively in the dorsal region of the spinal cord and branchial arch- 1, whereas Arnt expression was broadly distributed in the ventral portion of the mesodermal and endodermal tissues.

[10153] Animal model experiments lend further support to the function of ARNT2. To assess the role of ARNT2 in development and determine functional overlap with ARNT, Keith et al. (2001) generated a targeted null mutation of the murine Arnt2 locus. Arnt2 - /- embryos died perinatally and exhibited impaired hypothalamic development, phenotypes previously observed for a targeted mutation in the murine Sim1 gene and consistent with the proposal by Michaud et al. (2000) that Arnt2 and Sim1 form an essen-

tial heterodimer in vivo. In addition, cultured Arnt2 - /- neurons displayed decreased hypoxic induction of HIF1A target genes, demonstrating formally that ARNT2/HIF1A complexes regulate oxygen- responsive genes. Finally, a strong genetic interaction between Arnt and Arnt2 mutations was observed, indicating that either gene can fulfill essential functions in a dose- dependent manner before embryonic day 8.5. These results demonstrated that Arnt and Arnt2 have both unique and overlapping essential functions in embryonic development.

[10154] It is appreciated that the abovementioned animal model for ARNT2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[10155] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10156] Hirose, K.; Morita, M.; Ema, M.; Mimura, J.; Hamada, H.; Fujii, H.; Saijo, Y.; Gotoh, O.; Sogawa, K.; Fujii- Kuriyama, Y. : cDNA cloning and tissue- specific expression of a novel basic helix- loop- helix/PAS factor (Arnt2) with close sequence similarity to the aryl hydrocarbon receptor nuclear translocator (Arnt). 1713, 1996. ; and

[10157] Keith, B.; Adelman, D. M.; Simon, M. C. : Targeted mutation of the murine arylhydrocarbon receptor nuclear translocator 2 (Arnt2) gene reveals partial redundancy with Arnt. Proc. Nat. Ac.

[10158] Further studies establishing the function and utilities of ARNT2 are found in John Hopkins OMIM database record ID 606036, and in cited publications listed in Table 5, which are hereby incorporated by reference.BRD8 (Accession NP_006687.2) is another GAM67 target gene, herein designated TARGET GENE. BRD8 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BRD8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BRD8 BINDING SITE, designated SEQ ID:5029, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10159] Another function of GAM67 is therefore inhibition of BRD8 (Accession NP_006687.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD8.

[10160] C14orf137 (Accession NP_075601.1) is another GAM67 target gene, herein designated TARGET GENE. C14orf137 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf137 BINDING SITE, designated SEQ ID:9342, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10161] Another function of GAM67 is therefore inhibition of C14orf137 (Accession NP_075601.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf137.

[10162] Chromosome 20 open reading frame 108 (C20orf108, Accession NP_543011.1) is another GAM67 target gene, herein designated TARGET GENE. C20orf108 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf108, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf108

BINDING SITE, designated SEQ ID:4739, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10163] Another function of GAM67 is therefore inhibition of Chromosome 20 open reading frame 108 (C20orf108, Accession NP_543011.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf108.

[10164] Cell division cycle 25a (CDC25A, Accession NP_001780.1) is another GAM67 target gene, herein designated TARGET GENE. CDC25A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CDC25A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDC25A BINDING SITE, designated SEQ ID:19913, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10165] Another function of GAM67 is therefore inhibition of Cell division cycle 25a (CDC25A, Accession NP_001780.1), a gene which is a tyrosine protein phosphatase required for progression of the cell cycle. and therefore may be associated with Oncogenesis. Accordingly, utilities of GAM67

include diagnosis, prevention and treatment of Oncogenesis, and of other diseases and clinical conditions associated with CDC25A.

[10166] The function of CDC25A has been established by previous studies. When exposed to ionizing radiation, eukaryotic cells activate checkpoint pathways to delay the progression of the cell cycle. Defects in the ionizing radiation- induced S- phase checkpoint cause 'radioresistant DNA synthesis,' a phenomenon that has been identified in cancer-prone patients suffering from ataxia- telangiectasia. The CDC25A phosphatase activates CDK2, needed for DNA synthesis, but becomes degraded in response to DNA damage or stalled replication. Falck et al. (2001) reported a functional link between ATM (OMIM Ref. No. 208900), checkpoint signaling kinase CHK2 (OMIM Ref. No. 604373), and CDC25A, and implicated this mechanism in controlling the S- phase checkpoint. Falck et al. (2001) showed that ionizing radiation- induced destruction of CDC25A requires both ATM and the CHK2- mediated phosphorylation of CDC25A on serine- 123. An ionizing radiation- induced loss of CDC25A protein prevents dephosphorylation of CDK2 and leads to a transient blockade of DNA replication. Falck et al. (2001) also showed

that tumor- associated CHK2 alleles cannot bind or phosphorylate CDC25A, and that cells expressing these CHK2 alleles, elevated CDC25A, or a CDK2 mutant unable to undergo inhibitory phosphorylation (OMIM Ref. No. CDK2AF) fail to inhibit DNA synthesis when irradiated. Falck et al. (2001) concluded that their results support CHK2 as a candidate tumor suppressor, and identify the ATM- - CHK2- - CDC25A- - CDK2 pathway as a genomic integrity checkpoint that prevents radioresistant DNA synthesis. Falck et al. (2002) demonstrated that experimental blockade of either the NBS1 (OMIM Ref. No. 602667)- MRE11 (OMIM Ref. No. 600814) function or the CHK2- triggered events leads to a partial radioresistant DNA synthesis phenotype in human cells. In contrast, concomitant interference with NBS1- MRE11 and the CHK2- CDC25A- CDK2 pathways entirely abolishes inhibition of DNA synthesis induced by ionizing radiation, resulting in complete radioresistant DNA synthesis analogous to that caused by defective ATM. In addition, CDK2- dependent loading of CDC45 (OMIM Ref. No. 603465) onto replication origins, a prerequisite for recruitment of DNA polymerase, was prevented upon irradiation of normal or NBS1/MRE11- defective cells but not cells with defective ATM. Falck et al.

(2002) concluded that in response to ionizing radiation, phosphorylation of NBS1 and CHK2 by ATM triggers 2 parallel branches of the DNA damage- dependent S-phase checkpoint that cooperate by inhibiting distinct steps of DNA replication. To protect genome integrity and ensure survival, eukaryotic cells exposed to genotoxic stress cease proliferating to provide time for DNA repair. Mailand et al. (2000) demonstrated that human cells respond to ultraviolet light or ionizing radiation by rapid, ubiquitin- and proteosome- dependent protein degradation of CDC25A, a phosphatase that is required for progression from G1 to S phase of the cell cycle. This response involved activated CHK1 protein kinase (OMIM Ref. No. 603078) but not the p53 (OMIM Ref. No. 191170) pathway, and the persisting inhibitory tyrosine phosphorylation of CDK2 (OMIM Ref. No. 116953) blocked entry into S phase and DNA replication. CDC25A- dependent cell cycle arrest occurs 1 to 2 hours after ultraviolet radiation, whereas the p53- p21 axis affects the cell cycle only several hours after ultraviolet treatment. Mailand et al. (2000) thus concluded that the checkpoint response to DNA damage occurs in 2 waves. Overexpression of CDC25A bypassed the mechanism of cell cycle arrest,

leading to enhanced DNA damage and decreased cell survival. Mailand et al. (2000) concluded that the results identified specific degradation of CDC25A as part of the DNA damage checkpoint mechanism and suggested how CDC25A overexpression in human cancers might contribute to tumorigenesis.

[10167]

[10168] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10169] Mailand, N.; Falck, J.; Lukas, C.; Syljuasen, R. G.; Welcker, M.; Bartek, J.; Lukas, J. : Rapid destruction of human Cdc25A in response to DNA damage. Science 288: 1425-1429, 2000. ; and

[10170] Falck, J.; Mailand, N.; Syljuasen, R. G.; Bartek, J.; Lukas, J. : The ATM- Chk2- Cdc25A checkpoint pathway guards against radioresistant DNA synthesis. Nature 410: 842-847, 2001.

[10171] Further studies establishing the function and utilities of CDC25A are found in John Hopkins OMIM database record ID 116947, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cadherin 12, type 2 (n-cadherin 2) (CDH12, Accession NP_004052.2) is

another GAM67 target gene, herein designated TARGET GENE. CDH12 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CDH12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDH12 BINDING SITE, designated SEQ ID:4140, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10172] Another function of GAM67 is therefore inhibition of Cadherin 12, type 2 (n-cadherin 2) (CDH12, Accession NP_004052.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH12.

[10173] COE2 (Accession XP_034639.1) is another GAM67 target gene, herein designated TARGET GENE. COE2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COE2 BINDING SITE, designated SEQ ID:5083, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also

designated SEQ ID:282.

[10174] Another function of GAM67 is therefore inhibition of COE2 (Accession XP_034639.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COE2.

[10175] Collagen, type iv, alpha 2 (COL4A2, Accession NP_001837.1) is another GAM67 target gene, herein designated TARGET GENE. COL4A2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by COL4A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL4A2 BINDING SITE, designated SEQ ID:1689, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10176] Another function of GAM67 is therefore inhibition of Collagen, type iv, alpha 2 (COL4A2, Accession NP_001837.1), a gene which is a member of a subfamily of collagen extracellular matrix proteins. and therefore may be associated with Alport disease,goodpasture antigen. Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of Alport disease,goodpasture antigen, and of

other diseases and clinical conditions associated with COL4A2.

[10177] The function of COL4A2 has been established by previous studies. See COL4A1 (OMIM Ref. No. 120130). Type IV collagen is associated with laminin, entactin, and heparan sulfate proteoglycans to form the sheetlike basement membranes that separate epithelium from connective tissue. The dispersion of the other collagen genes helps to avoid unequal crossing- over. Because the alpha- 1 and alpha- 2 chains of type IV collagen are highly divergent, close proximity on chromosome 13 carries less hazard of a disruptive event than might otherwise be the case. On the other hand, their coordinate regulation may be enhanced by the close situation. Brazel et al. (1988) determined sequences of cDNA and protein of the N- terminal 60% of the COL4A2 chain. Aligning the 2- alpha chains of type IV collagen from the N- terminus, they concluded that the alpha- 2 chain has 43 more amino acids than the alpha- 1 chain. Twenty- one of these additional residues form a disulfide- bridged loop within the triple helix, which is unique among all known collagens. The Goodpasture antigen appears to be part of the type IV collagen molecule. Abnormalities in or absence of the Goodpasture

antigen has been claimed in Alport disease The 2 subunit genes COL4A1 (OMIM Ref. No. 120130) and COL4A2 are transcribed divergently from a common promoter. They both contain activating elements which are indispensable for efficient transcription. Moreover, Haniel et al. (1995) demonstrated a novel silencer element within the human COL4A2 gene and localized it by deletion mapping to a 24- bp region within the third intron of the gene. The element is able to inhibit the promoters of both COL4A genes, as well as the unrelated herpes simplex virus thymidine kinase promoter, largely independent of its position and orientation relative to the transcription start site of the promoter. The silencer element is specifically recognized by a nuclear protein called SILBF. Mutation studies and deletion analysis by Haniel et al. (1995) demonstrated that binding of SILBF is not only necessary but also sufficient for the silencing function

[10178]

[10179] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10180] Brazel, D.; Pollner, R.; Oberbaumer, I.; Kuhn, K. : Human basement membrane collagen (type IV): the amino acid

sequence of the alpha- 2(IV) chain and its comparison with the alpha- 1(IV) chain reveals deletions in the alpha-1(IV) chain. Europ. J. Biochem. 172: 35- 42, 1988. ; and

[10181] Haniel, A.; Welge- Lussen, U.; Kuhn, K.; Poschl, E. : Identification and characterization of a novel transcriptional silencer in the human collagen type IV gene COL4A2. J. Biol. Chem. 270.

[10182] Further studies establishing the function and utilities of COL4A2 are found in John Hopkins OMIM database record ID 120090, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cartilage acidic protein 1 (CRTAC1, Accession NP_060528.1) is another GAM67 target gene, herein designated TARGET GENE. CRTAC1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CRTAC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CRTAC1 BINDING SITE, designated SEQ ID:15719, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10183] Another function of GAM67 is therefore inhibition of Cartilage acidic protein 1 (CRTAC1, Accession NP_060528.1) .

Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAC1.

[10184] Cullin 3 (CUL3, Accession NP_003581.1) is another GAM67 target gene, herein designated TARGET GENE. CUL3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CUL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CUL3 BINDING SITE, designated SEQ ID:15180, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10185] Another function of GAM67 is therefore inhibition of Cullin 3 (CUL3, Accession NP_003581.1), a gene which may target other proteins for ubiquitin- dependent proteolysis. Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUL3.

[10186] The function of CUL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM32.1.Cytochrome p450, subfamily ivf, polypeptide

3 (leukotriene b4 omega hydroxylase) (CYP4F3, Accession NP_000887.1) is another GAM67 target gene, herein designated TARGET GENE. CYP4F3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP4F3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP4F3 BINDING SITE, designated SEQ ID:5739, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10187] Another function of GAM67 is therefore inhibition of Cytochrome p450, subfamily ivf, polypeptide 3 (leukotriene b4 omega hydroxylase) (CYP4F3, Accession NP_000887.1), a gene which converts leukotriene B4 into the less active 20- hydroxy- leukotriene B4. Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP4F3.

[10188] The function of CYP4F3 has been established by previous studies. Leukotrienes are a group of bioactive compounds that play important roles in such processes as inflammation. Kikuta et al. (1993) isolated a cDNA for the human

leukotriene B4 omega- hydroxylase (LTB4H), an enzyme which catalyzes the omega- hydroxylation of leukotriene B4. Their cDNA encoded a 520- amino acid protein with a predicted molecular weight of 59,805 Da. The deduced amino acid sequence contains a cysteine in the conserved heme- binding domain near the C- terminus, which is a characteristic feature of the cytochrome P450 superfamily; the protein shares 31 to 44% similarity with CYP4A, CYP4B (OMIM Ref. No. 124075), and CYP4C. Kikuta et al. (1993) detected transcript from the LTB4H gene in polymorphonuclear leukocytes and leukocytes.

[10189]

[10190] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10191] Kikuta, Y.; Kato, M.; Yamashita, Y.; Miyauchi, Y.; Tanaka, K.; Kamada, N.; Kusunose, M. : Human leukotriene B4 omega- hydroxylase (CYP4F3) gene: molecular cloning and chromosomal localization. DNA Cell Biol. 17: 221-230, 1998. ; and

[10192] Kikuta, Y.; Kusunose, E.; Endo, K.; Yamamoto, S.; Sogawa, K.; Fujii- Kuriyama, Y.; Kusunose, M. : A novel form of cytochrome P- 450 family 4 in human polymorphonuclear

leukocytes: cDNA cl.

[10193] Further studies establishing the function and utilities of CYP4F3 are found in John Hopkins OMIM database record ID 601270, and in cited publications listed in Table 5, which are hereby incorporated by reference.E2f transcription factor 3 (E2F3, Accession NP_001940.1) is another GAM67 target gene, herein designated TARGET GENE. E2F3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by E2F3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of E2F3 BINDING SITE, designated SEQ ID:15738, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10194] Another function of GAM67 is therefore inhibition of E2f transcription factor 3 (E2F3, Accession NP_001940.1), a gene which binds dna and controls cell- cycle progression from g1 to s phase. and therefore may be associated with Hereditary autosomal dominant myoclonus dystonia. Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of Hereditary autosomal dominant myoclonus dystonia, and of other diseases and clinical con-

ditions associated with E2F3.

[10195] The function of E2F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.FLJ22031 (Accession NP_079350.1) is another GAM67 target gene, herein designated TARGET GENE. FLJ22031 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22031, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22031 BINDING SITE, designated SEQ ID:19766, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10196] Another function of GAM67 is therefore inhibition of FLJ22031 (Accession NP_079350.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22031.

[10197] FLJ23168 (Accession NP_079331.2) is another GAM67 target gene, herein designated TARGET GENE. FLJ23168 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23168, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23168 BINDING SITE, designated SEQ ID:16056, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10198] Another function of GAM67 is therefore inhibition of FLJ23168 (Accession NP_079331.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23168.

[10199] FLJ32065 (Accession NP_694577.1) is another GAM67 target gene, herein designated TARGET GENE. FLJ32065 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32065, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32065 BINDING SITE, designated SEQ ID:5508, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10200] Another function of GAM67 is therefore inhibition of FLJ32065 (Accession NP_694577.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32065.

[10201] FLJ34766 (Accession NP_848597.1) is another GAM67 target gene, herein designated TARGET GENE. FLJ34766 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ34766, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ34766 BINDING SITE, designated SEQ ID:6306, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10202] Another function of GAM67 is therefore inhibition of FLJ34766 (Accession NP_848597.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ34766.

[10203] FLJ40201 (Accession NP_689820.1) is another GAM67 target gene, herein designated TARGET GENE. FLJ40201 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ40201, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ40201 BINDING SITE, designated SEQ ID:9705, to the nucleotide sequence of GAM67 RNA, herein designated

GAM RNA, also designated SEQ ID:282.

[10204] Another function of GAM67 is therefore inhibition of FLJ40201 (Accession NP_689820.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ40201.

[10205] Frizzled homolog 4 (drosophila) (FZD4, Accession NP_036325.2) is another GAM67 target gene, herein designated TARGET GENE. FZD4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FZD4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FZD4 BINDING SITE, designated SEQ ID:2889, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10206] Another function of GAM67 is therefore inhibition of Frizzled homolog 4 (drosophila) (FZD4, Accession NP_036325.2), a gene which may function in cell polarity, cell fate specification and cancer; similar to frizzled receptor family, has seven transmembrane domains and therefore may be associated with Familial exudative vitreoretinopathy. Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of Familial exudative

vitreoretinopathy., and of other diseases and clinical conditions associated with FZD4.

[10207] The function of FZD4 has been established by previous studies. Members of the 'frizzled' (FZ) gene family (see OMIM Ref. No. 601766) encode 7- transmembrane domain proteins that are receptors for Wnt (see OMIM Ref. No. 164975) signaling proteins. By screening a human fetal lung cDNA library with an FZD4 cDNA fragment isolated from a human gastric cancer cDNA pool, Kirikoshi et al. (1999) obtained a full- length cDNA of FZD4. FZD4 encodes a deduced 537- amino acid protein that has a cysteine- rich domain in the N- terminal extracellular region, 2 cysteine residues in the second and third extracellular loops, 2 N- linked glycosylation extracellular sites, and the S/T- X- V motif in the C terminus. Amino acid sequence identity with other FZD proteins ranged from 39 to 52% in the N terminus to 42 to 69% in the transmembrane domains. Northern blot analysis revealed expression of a 7.7- kb transcript in large amounts in adult heart, skeletal muscle, ovary, and fetal kidney, in moderate amounts in adult liver, kidney, pancreas, spleen, and fetal lung, and in small amounts in placenta, adult lung, prostate, testis, colon, fetal brain, and liver. Expression was also strong in

HeLa cells but not in several cancer cell lines. Familial exudative vitreoretinopathy (FEVR) is a hereditary ocular disorder characterized by a failure of peripheral retinal vascularization. Loci associated with FEVR map to 11q13-q23 (EVR1; 133780), Xp11.4 (EVR2; 305390), and 11p13-p12 (EVR3; 605750). In a large Canadian family of British descent, Robitaille et al. (2002) demonstrated linkage to 11q13- q23 for autosomal dominant FEVR and refined the disease locus to a genomic region spanning 1.55 Mb. The region contained the FZD4 gene, which they subjected to mutation search and identified in affected individuals a deletion of 6 nucleotides, 1479- 1484, resulting in deletion of 2 highly conserved amino acids, met493 and trp494. In a second small family they found a deletion of 2 nucleotides, 1501- 1502, that resulted in a frameshift at leu501, creating a stop codon at residue 533. Both mutations were located in exon 2 and altered the seventh transmembrane domain and the intracellular carboxy-terminal tail, respectively. No mutations in FZD4 were detected in 3 other small families with FEVR. Robitaille et al. (2002) presented data indicating that the changes in FZD4 in these families with autosomal dominant FEVR represented loss of function mutations.

[10208]

[10209] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10210] Kirikoshi, H.; Sagara, N.; Koike, J.; Tanaka, K.; Sekihara, H.; Hirai, M.; Katoh, M. : Molecular cloning and characterization of human frizzled- 4 on chromosome 11q14- q21. Biochem. Biophys. Res. Commun. 264: 955- 961, 1999. ; and

[10211] Robitaille, J.; MacDonald, M. L. E.; Kaykas, A.; Sheldahl, L. C.; Zeisler, J.; Dube, M.- P.; Zhang, L.- H.; Singaraja, R. R.; Guernsey, D. L.; Zhang, B.; Siebert, L. F.; Hoskin- Mott, A.;.

[10212] Further studies establishing the function and utilities of FZD4 are found in John Hopkins OMIM database record ID 604579, and in cited publications listed in Table 5, which are hereby incorporated by reference.Hydroxyacyl-coenzyme a dehydrogenase/ 3-ketoacyl-coenzyme a thiolase/enoyl-coenzyme a hydratase (trifunctional protein), alpha subunit (HADHA, Accession NP_000173.2) is another GAM67 target gene, herein designated TARGET GENE. HADHA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HADHA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HADHA BINDING SITE, designated SEQ ID:6337, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10213] Another function of GAM67 is therefore inhibition of Hydroxyacyl-coenzyme a dehydrogenase/

3-ketoacyl-coenzyme a thiolase/enoyl-coenzyme a hydratase (trifunctional protein), alpha subunit (HADHA, Accession NP_000173.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HADHA.

[10214] Potassium voltage-gated channel, delayed-rectifier, subfamily s, member 2 (KCNS2, Accession XP_043106.1) is another GAM67 target gene, herein designated TARGET GENE. KCNS2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KCNS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNS2 BINDING SITE, designated SEQ ID:16743, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10215] Another function of GAM67 is therefore inhibition of Potassium voltage-gated channel, delayed-rectifier, subfamily s, member 2 (KCNS2, Accession XP_043106.1), a gene which mediates the voltage- dependent potassium ion permeability of excitable membranes. Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with KCNS2.

[10216] The function of KCNS2 has been established by previous studies. See KCNS1 (OMIM Ref. No. 602905). By searching an expressed sequence tag (EST) database with the peptide sequence of the silent Kv8.1 alpha subunit, Salinas et al. (1997) identified human cDNAs encoding KCNS2, which they called Kv9.2. Using these ESTs, the authors isolated a mouse Kcns2 cDNA from a brain cDNA library. The predicted 477- amino acid Kcns2 protein has all of the structural characteristics of an outward rectifier Kv alpha subunit, namely 6 transmembrane domains, a transmembrane region with 5 positively charged amino acids, and a conserved pore- forming region. Several putative phosphorylation sites are located in the cytoplasmic regions. Northern blot analysis showed that Kcns2 is expressed only in the brain. In situ hybridization detected high levels of Kcns2 mRNA in the olfactory bulb, cerebral cortex, hippocampal formation, habenula, basolateral amygdaloid nuclei, and cerebellum; expression was also found in the retina and spinal cord. Salinas et al. (1997) demonstrated that Kcns2 does not have potassium channel activity by itself but can modulate the activities of the Kv2.1 (see OMIM Ref. No. KCNB1; 600397) and Kv2.2 al-

pha subunits. By fluorescence in situ hybridization and radiation hybrid mapping, Banfi et al. (1996) mapped an EST (GenBank R19352) corresponding to the human KCNS2 gene (Salinas et al., 1997) to 8q22.

[10217]

[10218] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10219] Banfi, S.; Borsani, G.; Rossi, E.; Bernard, L.; Guffanti, A.; Rubboli, F.; Marchitiello, A.; Giglio, S.; Coluccia, E.; Zollo, M.; Zuffardi, O.; Ballabio, A. : Identification and mapping of human cDNAs homologous to Drosophila mutant genes through EST database searching. [10221] Further studies establishing the function and utilities of KCNS2 are found in John Hopkins OMIM database record ID 602906, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0182 (Accession XP_050495.4) is another GAM67 target gene,

herein designated TARGET GENE. KIAA0182 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0182, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0182 BINDING SITE, designated SEQ ID:16445, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10222] Another function of GAM67 is therefore inhibition of KIAA0182 (Accession XP_050495.4) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0182.

[10223] KIAA0298 (Accession XP_084529.6) is another GAM67 target gene, herein designated TARGET GENE. KIAA0298 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0298, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0298 BINDING SITE, designated SEQ ID:2259, to the nucleotide sequence of GAM67 RNA, herein designated

GAM RNA, also designated SEQ ID:282.

[10224] Another function of GAM67 is therefore inhibition of KIAA0298 (Accession XP_084529.6) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0298.

[10225] KIAA0368 (Accession XP_036708.6) is another GAM67 target gene, herein designated TARGET GENE. KIAA0368 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0368, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0368 BINDING SITE, designated SEQ ID:19247, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10226] Another function of GAM67 is therefore inhibition of KIAA0368 (Accession XP_036708.6) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0368.

[10227] KIAA0514 (Accession NP_055511.1) is another GAM67 target gene, herein designated TARGET GENE. KIAA0514

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0514, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:16457, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10228] Another function of GAM67 is therefore inhibition of KIAA0514 (Accession NP_055511.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514.

[10229] KIAA0774 (Accession XP_166270.1) is another GAM67 target gene, herein designated TARGET GENE. KIAA0774 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0774, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0774 BINDING SITE, designated SEQ ID:19740, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10230] Another function of GAM67 is therefore inhibition of KIAA0774 (Accession XP_166270.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0774.

[10231] KIAA1359 (Accession XP_116034.2) is another GAM67 target gene, herein designated TARGET GENE. KIAA1359 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1359, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1359 BINDING SITE, designated SEQ ID:2094, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10232] Another function of GAM67 is therefore inhibition of KIAA1359 (Accession XP_116034.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1359.

[10233] KIAA1443 (Accession NP_065885.1) is another GAM67 target gene, herein designated TARGET GENE. KIAA1443 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1443, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1443 BINDING SITE, designated SEQ ID:15959, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10234] Another function of GAM67 is therefore inhibition of KIAA1443 (Accession NP_065885.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1443.

[10235] KIAA1724 (Accession XP_040280.2) is another GAM67 target gene, herein designated TARGET GENE. KIAA1724 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1724, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1724 BINDING SITE, designated SEQ ID:5509, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10236] Another function of GAM67 is therefore inhibition of

KIAA1724 (Accession XP_040280.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1724.

[10237] KIAA1853 (Accession XP_045184.1) is another GAM67 target gene, herein designated TARGET GENE. KIAA1853 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1853, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1853 BINDING SITE, designated SEQ ID:16006, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10238] Another function of GAM67 is therefore inhibition of KIAA1853 (Accession XP_045184.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1853.

[10239] KIAA1946 (Accession NP_803237.1) is another GAM67 target gene, herein designated TARGET GENE. KIAA1946 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1946, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1946 BINDING SITE, designated SEQ ID:10647, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10240] Another function of GAM67 is therefore inhibition of KIAA1946 (Accession NP_803237.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1946.

[10241] Karyopherin alpha 3 (importin alpha 4) (KPNA3, Accession NP_002258.1) is another GAM67 target gene, herein designated TARGET GENE. KPNA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KPNA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KPNA3 BINDING SITE, designated SEQ ID:15262, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10242] Another function of GAM67 is therefore inhibition of Karyopherin alpha 3 (importin alpha 4) (KPNA3, Accession

NP_002258.1), a gene which seems to act as a cytosolic receptor for both simple and bipartite nls motifs. Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNA3.

[10243] The function of KPNA3 has been established by previous studies. The transport of molecules between the nucleus and the cytoplasm in eukaryotic cells is mediated by the nuclear pore complex (NPC), which consists of 60 to 100 proteins and is probably 120 million daltons in molecular size. Small molecules (up to 70 kD) can pass through the nuclear pore by nonselective diffusion; larger molecules are transported by an active process. Most nuclear proteins contain short basic amino acid sequences known as nuclear localization signals (NLSs). The import of nuclear proteins from cytoplasm to nucleus occurs in 2 steps. First, nuclear proteins are recognized by cytoplasmic NLS receptors and bind to the cytoplasmic face of the NPC. Second, the NLS substrates are transported to the interior of the nucleus through the NPC; this step requires ATP hydrolysis. In extracts from Xenopus oocytes, Moore and Blobel (1992) identified 2 fractions, A and B, that contribute respectively to the first and second steps of nu-

clear import. See karyopherin alpha- 1 (KPNA1; 600686) and alpha- 2 (KPNA2; 600685). From a human fetal brain cDNA library, Takeda et al. (1997) isolated and characterized a novel gene, designated KPNA3, encoding a protein highly homologous to certain nuclear transport proteins of Xenopus and human. The complete cDNA clone contained an open reading frame of 1,563 bp encoding 521 amino acids. The predicted amino acid sequence shows 48%, 45%, and 48% identity with Xenopus importin, yeast SRP1, and human RCH1 (KPNA2), respectively. The similarities among these proteins suggested that karyopherin alpha- 3 may be involved in the nuclear transport system. Kohler et al. (1997) isolated a human KPNA3 cDNA. The predicted KPNA3 protein contains an N- terminal importin- beta- binding (IBB) domain, 8 armadillo repeats, and a C- terminal acidic region, all of which are characteristics of importin- alphas. Of the known human importin- alphas, KPNA3 shares the highest sequence identity with KPNA4 (OMIM Ref. No. 602970). Northern blot analysis detected a 4.6- kb KPNA3 transcript in all tissues tested. However, expression levels varied considerably among tissues, with the highest expression in testis and colon and the lowest expression in liver, kidney, and pe-

ripheral blood leukocytes

[10244]

[10245] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10246] Kohler, M.; Ansieau, S.; Prehn, S.; Leutz, A.; Haller, H.; Hartmann, E. : Cloning of two novel human importin- alpha subunits and analysis of the expression pattern of the importin- alpha protein family. FEBS Lett. 417: 104- 108, 1997. ; and

[10247] Moore, M. S.; Blobel, G. : The two steps of nuclear import, targeting to the nuclear envelope and translocation through the nuclear pore, require different cytosolic factors. Cell 69: 93.

[10248] Further studies establishing the function and utilities of KPNA3 are found in John Hopkins OMIM database record ID 601892, and in cited publications listed in Table 5, which are hereby incorporated by reference.LOC133418 (Accession XP_059649.4) is another GAM67 target gene, herein designated TARGET GENE. LOC133418 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC133418, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC133418 BINDING SITE, designated SEQ ID:5908, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10249] Another function of GAM67 is therefore inhibition of LOC133418 (Accession XP_059649.4) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133418.

[10250] LOC149050 (Accession XP_017261.1) is another GAM67 target gene, herein designated TARGET GENE. LOC149050 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149050, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149050 BINDING SITE, designated SEQ ID:13860, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10251] Another function of GAM67 is therefore inhibition of LOC149050 (Accession XP_017261.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149050.

[10252] LOC196403 (Accession XP_116915.2) is another GAM67 target gene, herein designated TARGET GENE. LOC196403 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196403, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196403 BINDING SITE, designated SEQ ID:6306, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10253] Another function of GAM67 is therefore inhibition of LOC196403 (Accession XP_116915.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196403.

[10254] LOC221042 (Accession XP_167669.2) is another GAM67 target gene, herein designated TARGET GENE. LOC221042 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221042, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC221042 BINDING SITE, designated SEQ ID:9749, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10255] Another function of GAM67 is therefore inhibition of LOC221042 (Accession XP_167669.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221042.

[10256] LOC223075 (Accession XP_167336.2) is another GAM67 target gene, herein designated TARGET GENE. LOC223075 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC223075, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC223075 BINDING SITE, designated SEQ ID:2240, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10257] Another function of GAM67 is therefore inhibition of LOC223075 (Accession XP_167336.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC223075.

[10258] LOC253842 (Accession XP_173230.1) is another GAM67 target gene, herein designated TARGET GENE. LOC253842 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC253842, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253842 BINDING SITE, designated SEQ ID:5240, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10259] Another function of GAM67 is therefore inhibition of LOC253842 (Accession XP_173230.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253842.

[10260] LOC283658 (Accession XP_211150.1) is another GAM67 target gene, herein designated TARGET GENE. LOC283658 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283658, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC283658 BINDING SITE, designated SEQ ID:16123, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10261] Another function of GAM67 is therefore inhibition of LOC283658 (Accession XP_211150.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283658.

[10262] LOC284355 (Accession XP_209160.1) is another GAM67 target gene, herein designated TARGET GENE. LOC284355 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284355, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284355 BINDING SITE, designated SEQ ID:13410, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10263] Another function of GAM67 is therefore inhibition of LOC284355 (Accession XP_209160.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284355.

[10264] LOC284678 (Accession XP_209318.1) is another GAM67 target gene, herein designated TARGET GENE. LOC284678 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284678, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284678 BINDING SITE, designated SEQ ID:17988, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10265] Another function of GAM67 is therefore inhibition of LOC284678 (Accession XP_209318.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284678.

[10266] LOC284988 (Accession XP_209429.2) is another GAM67 target gene, herein designated TARGET GENE. LOC284988 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284988, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284988 BINDING SITE, designated SEQ ID:11370, to

the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10267] Another function of GAM67 is therefore inhibition of LOC284988 (Accession XP_209429.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284988.

[10268] LOC286209 (Accession XP_209946.1) is another GAM67 target gene, herein designated TARGET GENE. LOC286209 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286209, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286209 BINDING SITE, designated SEQ ID:19868, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10269] Another function of GAM67 is therefore inhibition of LOC286209 (Accession XP_209946.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286209.

[10270] LOC286562 (Accession XP_210107.1) is another GAM67

target gene, herein designated TARGET GENE. LOC286562 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286562, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286562 BINDING SITE, designated SEQ ID:6979, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10271] Another function of GAM67 is therefore inhibition of LOC286562 (Accession XP_210107.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286562.

[10272] LOC339600 (Accession XP_295014.1) is another GAM67 target gene, herein designated TARGET GENE. LOC339600 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339600, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339600 BINDING SITE, designated SEQ ID:15712, to the nucleotide sequence of GAM67 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:282.

[10273] Another function of GAM67 is therefore inhibition of LOC339600 (Accession XP_295014.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339600.

[10274] LOC93097 (Accession XP_049221.1) is another GAM67 target gene, herein designated TARGET GENE. LOC93097 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC93097, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC93097 BINDING SITE, designated SEQ ID:1803, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10275] Another function of GAM67 is therefore inhibition of LOC93097 (Accession XP_049221.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93097.

[10276] MGC10715 (Accession NP_077301.4) is another GAM67 target gene, herein designated TARGET GENE. MGC10715

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC10715, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10715 BINDING SITE, designated SEQ ID:13051, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10277] Another function of GAM67 is therefore inhibition of MGC10715 (Accession NP_077301.4) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10715.

[10278] Opsin 1 (cone pigments), long-wave-sensitive (color blindness, protan) (OPN1LW, Accession XP_301073.1) is another GAM67 target gene, herein designated TARGET GENE. OPN1LW BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OPN1LW, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OPN1LW BINDING SITE, designated SEQ ID:11329, to the nucleotide sequence of GAM67 RNA,

herein designated GAM RNA, also designated SEQ ID:282.

[10279] Another function of GAM67 is therefore inhibition of Opsin 1 (cone pigments), long-wave-sensitive (color blindness, protan) (OPN1LW, Accession XP_301073.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPN1LW.

[10280] Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663164.1) is another GAM67 target gene, herein designated TARGET GENE. OSBPL3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:1991, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10281] Another function of GAM67 is therefore inhibition of Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663164.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3.

[10282] Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663163.1) is another GAM67 target gene, herein designated TARGET GENE. OSBPL3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:1991, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10283] Another function of GAM67 is therefore inhibition of Oxysterol binding protein-like 3 (OSBPL3, Accession NP_663163.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3.

[10284] Protein phosphatase 1, regulatory subunit 10 (PPP1R10, Accession NP_002705.2) is another GAM67 target gene, herein designated TARGET GENE. PPP1R10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPP1R10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of PPP1R10 BINDING SITE, designated SEQ ID:14628, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10285] Another function of GAM67 is therefore inhibition of Protein phosphatase 1, regulatory subunit 10 (PPP1R10, Accession NP_002705.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R10.

[10286] Rab interacting factor (RABIF, Accession NP_002862.2) is another GAM67 target gene, herein designated TARGET GENE. RABIF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RABIF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RABIF BINDING SITE, designated SEQ ID:19664, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10287] Another function of GAM67 is therefore inhibition of Rab interacting factor (RABIF, Accession NP_002862.2), a gene which is involved in the regulation of intracellular vesicular transport. Accordingly, utilities of GAM67 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with RABIF.

[10288] The function of RABIF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.RNPC4 (Accession NP_060577.2) is another GAM67 target gene, herein designated TARGET GENE. RNPC4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNPC4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNPC4 BINDING SITE, designated SEQ ID:1626, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10289] Another function of GAM67 is therefore inhibition of RNPC4 (Accession NP_060577.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPC4.

[10290] Sterol regulatory element binding transcription factor 1 (SREBF1, Accession NP_004167.3) is another GAM67 target gene, herein designated TARGET GENE. SREBF1 BINDING SITE is a target binding site found in the 3` untrans-

lated region of mRNA encoded by SREBF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SREBF1 BINDING SITE, designated SEQ ID:9185, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10291] Another function of GAM67 is therefore inhibition of Sterol regulatory element binding transcription factor 1 (SREBF1, Accession NP_004167.3), a gene which is a transcriptional activator that binds to the sterol regulatory element 1. Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SREBF1.

[10292] The function of SREBF1 has been established by previous studies. SREBP1 is synthesized as a 125- kD precursor that is attached to the nuclear membrane and endoplasmic reticulum (ER). Wang et al. (1994) found that in sterol- depleted cells, the membrane- bound precursor is cleaved to generate a soluble N- terminal fragment (apparent molecular mass, 68 kD) that translocates to the nucleus. This fragment, which includes the bHLH- Zip domain, activates transcription of the genes for the LDL re-

ceptor and HMG- CoA synthase (OMIM Ref. No. 142940). Sterols inhibit the cleavage of SREBP1, and the 68- kD nuclear form is rapidly catabolized, thereby reducing transcription. N- acetyl- leucyl- leucyl- norleucinal (ALLN), an inhibitor of neutral cysteine proteases, blocked the breakdown of the 68- kD form and superinduced sterol- regulated genes. Sterol- regulated proteolysis of a membrane-bound transcription factor is a novel mechanism by which transcription can be regulated by membrane lipids

[10293] Animal model experiments lend further support to the function of SREBF1. Shimomura et al. (1998) produced transgenic mice that overexpressed nuclear SREBP1C in adipose tissue under the control of the adipocyte- specific aP2 (OMIM Ref. No. 600434) enhancer/promoter. These mice exhibited many of the features of congenital generalized lipodystrophy (BSCL; 269700). White fat failed to differentiate fully, and the size of the white fat deposits was markedly decreased. Brown fat was hypertrophic and contained fat- laden cells resembling immature white fat. Levels of mRNA encoding adipocyte differentiation markers, including leptin (OMIM Ref. No. 164160), were reduced, but levels of PREF1 (OMIM Ref. No. 176290) and TNF- alpha (OMIM Ref. No. 191160) were increased.

Marked insulin resistance with 60- fold elevation in plasma insulin was observed. Diabetes mellitus with elevated blood glucose of greater than 300 mg/dl that failed to decline when insulin was injected was also seen. The transgenic mice had fatty liver from birth and developed elevated plasma triglyceride levels later in life.

[10294] It is appreciated that the abovementioned animal model for SREBF1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[10295] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10296] Shimomura, I.; Hammer, R. E.; Richardson, J. A.; Ikemoto, S.; Bashmakov, Y.; Goldstein, J. L.; Brown, M. S. : Insulin resistance and diabetes mellitus in transgenic mice expressing nuclear SREBP- 1c in adipose tissue: model for congenital generalized lipodystrophy. Genes Dev. 12: 3182- 3194, 1998. ; and

[10297] Wang, X.; Sato, R.; Brown, M. S.; Hua, X.; Goldstein, J. L. : SREBP- 1, a membrane- bound transcription factor released by sterol- regulated proteolysis. Cell 77: 53- 62, 1994.

[10298] Further studies establishing the function and utilities of SREBF1 are found in John Hopkins OMIM database record ID 184756, and in cited publications listed in Table 5, which are hereby incorporated by reference.Synaptopodin 2 (SYNPO2, Accession XP_050219.2) is another GAM67 target gene, herein designated TARGET GENE. SYNPO2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SYNPO2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYNPO2 BINDING SITE, designated SEQ ID:12148, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10299] Another function of GAM67 is therefore inhibition of Synaptopodin 2 (SYNPO2, Accession XP_050219.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNPO2.

[10300] Synaptotagmin xi (SYT11, Accession NP_689493.2) is another GAM67 target gene, herein designated TARGET GENE. SYT11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SYT11,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYT11 BINDING SITE, designated SEQ ID:2632, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10301] Another function of GAM67 is therefore inhibition of Synaptotagmin xi (SYT11, Accession NP_689493.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT11.

[10302] Taf4 rna polymerase ii, tata box binding protein (tbp)-associated factor, 135kda (TAF4, Accession NP_003176.1) is another GAM67 target gene, herein designated TARGET GENE. TAF4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TAF4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TAF4 BINDING SITE, designated SEQ ID:9232, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10303] Another function of GAM67 is therefore inhibition of Taf4

rna polymerase ii, tata box binding protein (tbp)-associated factor, 135kda (TAF4, Accession NP_003176.1), a gene which plays a central role in mediating promoter responses to various activators and repressors. Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF4.

[10304] The function of TAF4 has been established by previous studies. Transcription factor TFIID is a multiprotein complex composed of the TATA box- binding protein (TBP; 600075) and multiple TBP- associated factors (TAFs; OMIM Ref. No. 313650). Tanese et al. (1996) cloned cDNAs encoding 2 subunits of the human TFIID complex: TAFII130 (also symbolized TAF2C1) and TAFII100 (TAF2D; 601787). The longest partial cDNA representing human TAFII130 encodes the predicted C- terminal 947 amino acids of the protein and 1.4 kb of 3- prime untranslated sequence; this cDNA appeared to be missing approximately 100 N- terminal amino acids of TAFII130. Tanese et al. (1996) showed that recombinant TAFII100 and TAFII130 associated with endogenous TAFs and TBP to form a TFIID complex in transfected 293 cells. Their experiments also suggested a role for TAFII130 as a direct

coactivator target for Sp1 (OMIM Ref. No. 189906). See also TAF2C2 (OMIM Ref. No. 601689). By biochemical purification and genomic screening, Mengus et al. (1997) obtained a full- length cDNA encoding TAF2C1. Sequence analysis predicted that the 1,083- amino acid protein contains a C- terminal domain and a central region highly homologous to those of TAF2C2. TAF2C1 expression was found to enhance transactivation by the class II nuclear receptors RAR (see OMIM Ref. No. 180240), THRA (see OMIM Ref. No. 190120), and VDR (OMIM Ref. No. 601769) through activation function- 2 in the C- terminal ligand-binding domain.

[10305]

[10306] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10307] Mengus, G.; May, M.; Carre, L.; Chambon, P.; Davidson, I. : Human TAF(II)135 potentiates transcriptional activation by the AF- 2s of the retinoic acid, vitamin D3, and thyroid hormone receptors in mammalian cells. Genes Dev. 11: 1381- 1395, 1997. ; and

[10308] Tanese, N.; Saluja, D.; Vassallo, M. F.; Chen, J.- L.; Admon, A. : Molecular cloning and analysis of two subunits of the

human TFIID complex: hTAFII130 and hTAFII100. Proc. Nat. Acad. S.

[10309] Further studies establishing the function and utilities of TAF4 are found in John Hopkins OMIM database record ID 601796, and in cited publications listed in Table 5, which are hereby incorporated by reference.Transmembrane 4 superfamily member 2 (TM4SF2, Accession NP_004606.2) is another GAM67 target gene, herein designated TARGET GENE. TM4SF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TM4SF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TM4SF2 BINDING SITE, designated SEQ ID:1003, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10310] Another function of GAM67 is therefore inhibition of Transmembrane 4 superfamily member 2 (TM4SF2, Accession NP_004606.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM4SF2.

[10311] Ubiquitin-conjugating enzyme e2, j1 (ubc6 homolog, yeast) (UBE2J1, Accession NP_057105.1) is another GAM67

target gene, herein designated TARGET GENE. UBE2J1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UBE2J1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE2J1 BINDING SITE, designated SEQ ID:4859, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10312] Another function of GAM67 is therefore inhibition of Ubiquitin-conjugating enzyme e2, j1 (ubc6 homolog, yeast) (UBE2J1, Accession NP_057105.1) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2J1.

[10313] UPF3B (Accession NP_075386.1) is another GAM67 target gene, herein designated TARGET GENE. UPF3B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UPF3B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UPF3B BINDING SITE, designated SEQ ID:4390,

to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10314] Another function of GAM67 is therefore inhibition of UPF3B (Accession NP_075386.1), a gene which facilitates the export of spliced mRNAs and may function as a positive regulator for mannosylphosphate transferase. Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UPF3B.

[10315] The function of UPF3B has been established by previous studies. Lykke- Andersen et al. (2000) found that UPF2, UPF3A, and UPF3B were complexed with UPF1 (RENT1; 601430) while in HeLa cell extracts. In intact cells, UPF3A and UPF3B were found to be nucleocytoplasmic shuttling proteins, while UPF2 was perinuclear, and UPF1 was cytoplasmic. UPF3A and UPF3B associated selectively with spliced beta- globin (OMIM Ref. No. 141900) mRNA in vivo, and tethering of any UPF protein to the 3- prime untranslated region of beta- globin mRNA elicited NMD. These data suggested that assembly of a dynamic human UPF complex initiates in the nucleus at mRNA exon- exon junctions and triggers NMD in the cytoplasm when recognized downstream of a translation termination site. By im-

munoprecipitation and immunoblot analyses of nucleo- plasmic fractions, Kim et al. (2001) showed that UPF3A and UPF3B are associated in an RNase- resistant manner with Y14 (RBM8A; 605313), as well as with the mRNA ex- port factors ALY (OMIM Ref. No. 604171) and TAP (NXF1; 602647), in mRNA- protein complexes. UPF3 proteins ap- peared to bind immediately upstream of exon- exon junctions. Kim et al. (2001) concluded that UPF3 proteins facilitate the export of spliced mRNAs by recruiting mRNA export proteins. They proposed that UPF3 functions in NMD and travels with the mRNA to the cytoplasm, where a leading translating ribosome displaces the UPF3- Y14 complexes from the mRNA.

[10316]

[10317] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10318] Lykke- Andersen, J.; Shu, M.- D.; Steitz, J. A. : Human Upf proteins target an mRNA for nonsense- mediated decay when bound downstream of a termination codon. Cell 103: 1121- 1131, 2000. ; and

[10319] Kim, V. N.; Kataoka, N.; Dreyfuss, G. : Role of the non- sense- mediated decay factor hUpf3 in the splicing- de-

pendent exon- exon junction complex. Science 293: 1832- 1836, 2001.

[10320] Further studies establishing the function and utilities of UPF3B are found in John Hopkins OMIM database record ID 300298, and in cited publications listed in Table 5, which are hereby incorporated by reference.UPF3B (Accession NP_542199.1) is another GAM67 target gene, herein designated TARGET GENE. UPF3B BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UPF3B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UPF3B BINDING SITE, designated SEQ ID:4390, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10321] Another function of GAM67 is therefore inhibition of UPF3B (Accession NP_542199.1), a gene which facilitates the export of spliced mRNAs and may function as a positive regulator for mannosylphosphate transferase. Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UPF3B.

[10322] The function of UPF3B has been established by previous studies. Lykke- Andersen et al. (2000) found that UPF2, UPF3A, and UPF3B were complexed with UPF1 (RENT1; 601430) while in HeLa cell extracts. In intact cells, UPF3A and UPF3B were found to be nucleocytoplasmic shuttling proteins, while UPF2 was perinuclear, and UPF1 was cytoplasmic. UPF3A and UPF3B associated selectively with spliced beta- globin (OMIM Ref. No. 141900) mRNA in vivo, and tethering of any UPF protein to the 3- prime untranslated region of beta- globin mRNA elicited NMD. These data suggested that assembly of a dynamic human UPF complex initiates in the nucleus at mRNA exon- exon junctions and triggers NMD in the cytoplasm when recognized downstream of a translation termination site. By immunoprecipitation and immunoblot analyses of nucleoplasmic fractions, Kim et al. (2001) showed that UPF3A and UPF3B are associated in an RNase- resistant manner with Y14 (RBM8A; 605313), as well as with the mRNA export factors ALY (OMIM Ref. No. 604171) and TAP (NXF1; 602647), in mRNA- protein complexes. UPF3 proteins appeared to bind immediately upstream of exon- exon junctions. Kim et al. (2001) concluded that UPF3 proteins facilitate the export of spliced mRNAs by recruiting mRNA

export proteins. They proposed that UPF3 functions in NMD and travels with the mRNA to the cytoplasm, where a leading translating ribosome displaces the UPF3- Y14 complexes from the mRNA.

[10323]

[10324] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10325] Lykke- Andersen, J.; Shu, M.- D.; Steitz, J. A. : Human Upf proteins target an mRNA for nonsense- mediated decay when bound downstream of a termination codon. Cell 103: 1121- 1131, 2000. ; and

[10326] Kim, V. N.; Kataoka, N.; Dreyfuss, G. : Role of the non- sense- mediated decay factor hUpf3 in the splicing- de- pendent exon- exon junction complex. Science 293: 1832- 1836, 2001.

[10327] Further studies establishing the function and utilities of UPF3B are found in John Hopkins OMIM database record ID 300298, and in cited publications listed in Table 5, which are hereby incorporated by reference.Zinc finger protein 323 (ZNF323, Accession NP_112161.2) is another GAM67 target gene, herein designated TARGET GENE. ZNF323 BINDING SITE is a target binding site found in the

3` untranslated region of mRNA encoded by ZNF323, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF323 BINDING SITE, designated SEQ ID:12107, to the nucleotide sequence of GAM67 RNA, herein designated GAM RNA, also designated SEQ ID:282.

[10328] Another function of GAM67 is therefore inhibition of Zinc finger protein 323 (ZNF323, Accession NP_112161.2) . Accordingly, utilities of GAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF323.

[10329]

[10330] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 68 (GAM68), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10331] GAM68 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM68 was detected is described hereinabove with reference to Figs. 8-15.

[10332] GAM68 gene, herein designated GAM GENE, and GAM68 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[10333] GAM68 gene encodes a GAM68 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM68 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM68 precursor RNA is designated SEQ ID:128, and is provided hereinbelow with reference to the sequence listing part.

[10334] GAM68 precursor RNA folds onto itself, forming GAM68 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10335] GAM68 precursor RNA folds onto itself, forming GAM68 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[10336] Nucleotide sequence of GAM68 precursor RNA, designated SEQ-ID: 128, and a schematic representation of a predicted secondary folding of GAM68 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[10337] An enzyme complex designated DICER COMPLEX, `dices` the GAM68 folded precursor RNA into GAM68 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM68 RNA is designated SEQ ID:251, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[10338] GAM68 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM68 target RNA, herein designated GAM TARGET RNA. GAM68 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10339] GAM68 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM68 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM68 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM68 RNA may have a different number of target binding sites in untranslated regions of a GAM68 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an

example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10340] The complementary binding of GAM68 RNA, herein designated GAM RNA, to target binding sites on GAM68 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM68 target RNA into GAM68 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10341] It is appreciated that GAM68 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM68 target genes. The mRNA of each one of this plurality of GAM68 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM68 RNA, herein designated GAM RNA, and which when bound by GAM68 RNA causes inhibition of translation of respective one or more GAM68 target proteins.

[10342] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM68 gene, herein designated GAM GENE, on one or

more GAM68 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10343] It is appreciated that specific functions and accordingly utilities of GAM68 correlate with, and may be deduced from, the identity of the target genes which GAM68 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10344]

[10345]

[10346] Cadherin 13, h-cadherin (heart) (CDH13, Accession NM_001257.2) is a GAM68 target gene, herein designated TARGET GENE. CDH13 BINDING SITE is a target binding

site found in the 3` untranslated region of mRNA encoded by CDH13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CDH13 BINDING SITE, designated SEQ ID:8595, to the nucleotide sequence of GAM68 RNA, herein designated GAM RNA, also designated SEQ ID:251.

[10347] A function of GAM68 is therefore inhibition of Cadherin 13, h-cadherin (heart) (CDH13, Accession NM_001257.2) . Accordingly, utilities of GAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH13.

[10348] Dnaj (hsp40) homolog, subfamily c, member 5 (DNAJC5, Accession XM_028966.6) is another GAM68 target gene, herein designated TARGET GENE. DNAJC5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DNAJC5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNAJC5 BINDING SITE, designated SEQ ID:15877, to the nucleotide sequence of GAM68 RNA, herein designated GAM RNA, also designated SEQ ID:251.

[10349] Another function of GAM68 is therefore inhibition of Dnaj (hsp40) homolog, subfamily c, member 5 (DNAJC5, Accession XM_028966.6) . Accordingly, utilities of GAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJC5.

[10350] FENS-1 (Accession) is another GAM68 target gene, herein designated TARGET GENE. FENS-1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FENS-1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FENS-1 BINDING SITE, designated SEQ ID:6852, to the nucleotide sequence of GAM68 RNA, herein designated GAM RNA, also designated SEQ ID:251.

[10351] Another function of GAM68 is therefore inhibition of FENS-1 (Accession) . Accordingly, utilities of GAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FENS-1.

[10352] Glucocorticoid receptor dna binding factor 1 (GRLF1, Accession NM_024342.1) is another GAM68 target gene, herein designated TARGET GENE. GRLF1 BINDING SITE is a target binding site found in the 3` untranslated region of

multiple transcripts of mRNA encoded by GRLF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GRLF1 BINDING SITE, designated SEQ ID:486, to the nucleotide sequence of GAM68 RNA, herein designated GAM RNA, also designated SEQ ID:251.

[10353] Another function of GAM68 is therefore inhibition of Glucocorticoid receptor dna binding factor 1 (GRLF1, Accession NM_024342.1), a gene which inhibits transcription of the glucocorticoid receptor gene. Accordingly, utilities of GAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRLF1.

[10354] The function of GRLF1 has been established by previous studies. Using polyclonal antibodies against purified GRLF1, LeClerc et al. (1991) isolated a partial GRLF1 cDNA encoding a deduced 835- amino acid protein. The protein contains 3 possible zinc finger structures and a leucine zipper motif that contains 1 cysteine. Western blot analysis detected expression of a 94- kD GRLF1 protein. By sequence comparisons with rat p190A, database searching, and RT- PCR analysis, Tikoo et al. (2000) obtained a full-length cDNA sequence encoding GRLF1, the human ho-

molog of p190A. The deduced 1,514- amino acid protein is 97% identical to the rat sequence. The first 1,287 residues, including the GTPase and middle domains, are encoded by the 3.7- kb exon 1, similar to the structure observed in p190B (ARHGAP5; 602680).

[10355]

[10356] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10357] LeClerc, S.; Palaniswami, R.; Xie, B.; Govdan, M. V. : Molecular cloning and characterization of a factor that binds the human glucocorticoid receptor gene and represses its expression. J. Biol. Chem. 266: 17333- 17340, 1991. ; and

[10358] Tikoo, A.; Czekay, S.; Viars, C.; White, S.; Heath, J. K.; Arden, K.; Maruta, H. : p190- A, a human tumor suppressor gene, maps to the chromosomal region 19q13.3 that is reportedly delet.

[10359] Further studies establishing the function and utilities of GRLF1 are found in John Hopkins OMIM database record ID 605277, and in cited publications listed in Table 5, which are hereby incorporated by reference.SORCS2 (Accession NM_020777.1) is another GAM68 target gene, herein designated TARGET GENE. SORCS2 BINDING SITE is

a target binding site found in the 3` untranslated region of mRNA encoded by SORCS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SORCS2 BINDING SITE, designated SEQ ID:7018, to the nucleotide sequence of GAM68 RNA, herein designated GAM RNA, also designated SEQ ID:251.

[10360] Another function of GAM68 is therefore inhibition of SORCS2 (Accession NM_020777.1) . Accordingly, utilities of GAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS2.

[10361]

[10362] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 69 (GAM69), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10363] GAM69 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM69 was detected is described hereinabove with reference to Figs. 8-15.

[10364] GAM69 gene, herein designated GAM GENE, and GAM69 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[10365] GAM69 gene encodes a GAM69 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM69 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM69 precursor RNA is designated SEQ ID:96, and is provided hereinbelow with reference to the sequence listing part.

[10366] GAM69 precursor RNA folds onto itself, forming GAM69 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10367] GAM69 precursor RNA folds onto itself, forming GAM69 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[10368] Nucleotide sequence of GAM69 precursor RNA, designated SEQ-ID: 96, and a schematic representation of a predicted secondary folding of GAM69 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[10369] An enzyme complex designated DICER COMPLEX, `dices` the GAM69 folded precursor RNA into GAM69 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM69 RNA is designated SEQ ID:258, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[10370] GAM69 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM69 target RNA, herein designated GAM TARGET RNA. GAM69 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10371] GAM69 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM69 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM69 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM69 RNA may have a different number of target binding sites in untranslated regions of a GAM69 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an

example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10372] The complementary binding of GAM69 RNA, herein designated GAM RNA, to target binding sites on GAM69 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM69 target RNA into GAM69 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10373] It is appreciated that GAM69 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM69 target genes. The mRNA of each one of this plurality of GAM69 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM69 RNA, herein designated GAM RNA, and which when bound by GAM69 RNA causes inhibition of translation of respective one or more GAM69 target proteins.

[10374] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM69 gene, herein designated GAM GENE, on one or

more GAM69 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10375] It is appreciated that specific functions and accordingly utilities of GAM69 correlate with, and may be deduced from, the identity of the target genes which GAM69 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10376]

[10377]

[10378] Atp-binding cassette, sub-family b (mdr/tap), member 5 (ABCB5, Accession XP_291215.1) is a GAM69 target gene, herein designated TARGET GENE. ABCB5 BINDING SITE is a

target binding site found in the 3` untranslated region of mRNA encoded by ABCB5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCB5 BINDING SITE, designated SEQ ID:12174, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10379] A function of GAM69 is therefore inhibition of Atp-binding cassette, sub-family b (mdr/tap), member 5 (ABCB5, Accession XP_291215.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCB5.

[10380] Adenylate cyclase 5 (ADCY5, Accession XP_171048.2) is another GAM69 target gene, herein designated TARGET GENE. ADCY5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ADCY5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADCY5 BINDING SITE, designated SEQ ID:17269, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10381] Another function of GAM69 is therefore inhibition of Adenylate cyclase 5 (ADCY5, Accession XP_171048.2) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY5.

[10382] Adenylate cyclase 8 (brain) (ADCY8, Accession NP_001106.1) is another GAM69 target gene, herein designated TARGET GENE. ADCY8 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ADCY8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADCY8 BINDING SITE, designated SEQ ID:16440, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10383] Another function of GAM69 is therefore inhibition of Adenylate cyclase 8 (brain) (ADCY8, Accession NP_001106.1), a gene which this a membrane- bound, ca(2+)- inhibitable adenylyl cyclase. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY8.

[10384] The function of ADCY8 has been established by previous studies. Adenylyl cyclase (EC 4.6.1.1) catalyzes the trans-

formation of ATP into cyclic AMP. The enzymatic activity is under the control of several hormones, and different polypeptides participate in the transduction of the signal from the receptor to the catalytic moiety. Stimulatory or inhibitory receptors (Rs and Ri) interact with G proteins (Gs and Gi) that exhibit GTPase activity and they modulate the activity of the catalytic subunit of the adenylyl cyclase. Parma et al. (1991) cloned a cDNA corresponding to human brain adenylyl cyclase, symbolized by them as HBAC1. By in situ hybridization to metaphase chromosomal spreads using the human brain cDNA probe, Stengel et al. (1992) showed that the gene is located on 8q24.2. A highly homologous gene, ADCY2 (OMIM Ref. No. 103071), was assigned to 5p15.3 by the same method.

[10385]

[10386] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10387] Parma, J.; Stengel, D.; Gannage, M.- H.; Poyard, M.; Barouki, R.; Hanoune, J. : Sequence of a human brain adenylyl cyclase partial cDNA: evidence for a consensus cyclase domain. Biochem. Biophys. Res. Commun. 179: 455- 462, 1991. ; and

[10388] Stengel, D.; Parma, J.; Gannage, M.- H.; Roeckel, N.; Mattei, M.- G.; Barouki, R.; Hanoune, J. : Different chromosomal localization of two adenylyl cyclase genes expressed in human brain.

[10389] Further studies establishing the function and utilities of ADCY8 are found in John Hopkins OMIM database record ID 103070, and in cited publications listed in Table 5, which are hereby incorporated by reference.Adducin 2 (beta) (ADD2, Accession NP_059522.1) is another GAM69 target gene, herein designated TARGET GENE. ADD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADD2 BINDING SITE, designated SEQ ID:12249, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10390] Another function of GAM69 is therefore inhibition of Adducin 2 (beta) (ADD2, Accession NP_059522.1), a gene which membrane- cytoskeleton- protein that promotes the assembly of the spectrin- actin network. Accordingly, utilities of GAM69 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with ADD2.

[10391] The function of ADD2 has been established by previous studies. See alpha- adducin (ADD1; 102680). Adducin is a heterodimeric calmodulin (OMIM Ref. No. 114180)- binding protein of the cell- membrane skeleton, which is thought to play a role in assembly of the spectrin- actin lattice that underlies the plasma membrane (see OMIM Ref. No. also 182860 and 102560). Missense mutations in both the alpha- and beta- adducin genes that alter amino acids that are normally phosphorylated have been associated with the regulation of blood pressure in the Milan hypertensive strain (MHS) of rats (Bianchi et al., 1994). Muro et al. (2000) showed that in Add2 - /- mice, targeted disruption of the beta- adducin gene resulted in an 80% decrease of alpha- adducin and a 4- fold upregulation of gamma- adducin in erythrocytes. Elliptocytes, ovalocytes, and occasionally spherocytes were found in the blood smears of - /- mice. Mild hematologic findings were thought to be related to the amount of adducin remaining in the mutant animals (presumably alpha-gamma adducin).

[10392]

[10393] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10394] Bianchi, G.; Tripodi, G.; Casari, G.; Salardi, S.; Barber, B. R.; Garcia, R.; Leoni, P.; Torielli, L.; Cusi, D.; Ferrandi, M.; Pinna, L. A.; Baralle, F. E.; Ferrari, P. : Two point mutations within the adducin genes are involved in blood pressure variation. Proc. Nat. Acad. Sci. 91: 3999- 4003, 1994. ; and

[10395] Muro, A. F.; Marro, M. L.; Gajovic, S.; Porro, F.; Luzzatto, L.; Baralle, F. E. : Mild spherocytic hereditary elliptocytosis and altered levels of alpha- and gamma- adducins in beta- adduc.

[10396] Further studies establishing the function and utilities of ADD2 are found in John Hopkins OMIM database record ID 102681, and in cited publications listed in Table 5, which are hereby incorporated by reference.Adducin 2 (beta) (ADD2, Accession NP_059520.1) is another GAM69 target gene, herein designated TARGET GENE. ADD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of ADD2 BINDING SITE, designated SEQ ID:12249, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10397] Another function of GAM69 is therefore inhibition of Adducin 2 (beta) (ADD2, Accession NP_059520.1), a gene which membrane- cytoskeleton- protein that promotes the assembly of the spectrin- actin network. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD2.

[10398] The function of ADD2 has been established by previous studies. See alpha- adducin (ADD1; 102680). Adducin is a heterodimeric calmodulin (OMIM Ref. No. 114180)- binding protein of the cell- membrane skeleton, which is thought to play a role in assembly of the spectrin- actin lattice that underlies the plasma membrane (see OMIM Ref. No. also 182860 and 102560). Missense mutations in both the alpha- and beta- adducin genes that alter amino acids that are normally phosphorylated have been associated with the regulation of blood pressure in the Milan hypertensive strain (MHS) of rats (Bianchi et al., 1994). Muro et al. (2000) showed that in Add2 - /- mice, tar-

geted disruption of the beta- adducin gene resulted in an 80% decrease of alpha- adducin and a 4- fold upregulation of gamma- adducin in erythrocytes. Elliptocytes, ovalocytes, and occasionally spherocytes were found in the blood smears of - /- mice. Mild hematologic findings were thought to be related to the amount of adducin remaining in the mutant animals (presumably alpha-gamma adducin).

[10399]

[10400] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10401] Bianchi, G.; Tripodi, G.; Casari, G.; Salardi, S.; Barber, B. R.; Garcia, R.; Leoni, P.; Torielli, L.; Cusi, D.; Ferrandi, M.; Pinna, L. A.; Baralle, F. E.; Ferrari, P. : Two point mutations within the adducin genes are involved in blood pressure variation. Proc. Nat. Acad. Sci. 91: 3999- 4003, 1994. ; and

[10402] Muro, A. F.; Marro, M. L.; Gajovic, S.; Porro, F.; Luzzatto, L.; Baralle, F. E. : Mild spherocytic hereditary elliptocytosis and altered levels of alpha- and gamma- adducins in beta- adduc.

[10403] Further studies establishing the function and utilities of

ADD2 are found in John Hopkins OMIM database record ID 102681, and in cited publications listed in Table 5, which are hereby incorporated by reference.Adducin 2 (beta) (ADD2, Accession NP_001608.1) is another GAM69 target gene, herein designated TARGET GENE. ADD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADD2 BINDING SITE, designated SEQ ID:12249, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10404] Another function of GAM69 is therefore inhibition of Adducin 2 (beta) (ADD2, Accession NP_001608.1), a gene which membrane- cytoskeleton- protein that promotes the assembly of the spectrin- actin network. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD2.

[10405] The function of ADD2 has been established by previous studies. See alpha- adducin (ADD1; 102680). Adducin is a heterodimeric calmodulin (OMIM Ref. No. 114180)- bind-

ing protein of the cell- membrane skeleton, which is thought to play a role in assembly of the spectrin- actin lattice that underlies the plasma membrane (see OMIM Ref. No. also 182860 and 102560). Missense mutations in both the alpha- and beta- adducin genes that alter amino acids that are normally phosphorylated have been associated with the regulation of blood pressure in the Milan hypertensive strain (MHS) of rats (Bianchi et al., 1994). Muro et al. (2000) showed that in Add2 - /- mice, targeted disruption of the beta- adducin gene resulted in an 80% decrease of alpha- adducin and a 4- fold upregulation of gamma- adducin in erythrocytes. Elliptocytes, ovalocytes, and occasionally spherocytes were found in the blood smears of - /- mice. Mild hematologic findings were thought to be related to the amount of adducin remaining in the mutant animals (presumably alpha-gamma adducin).

[10406]

[10407] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10408] Bianchi, G.; Tripodi, G.; Casari, G.; Salardi, S.; Barber, B. R.; Garcia, R.; Leoni, P.; Torielli, L.; Cusi, D.; Ferrandi, M.;

Pinna, L. A.; Baralle, F. E.; Ferrari, P. : Two point mutations within the adducin genes are involved in blood pressure variation. Proc. Nat. Acad. Sci. 91: 3999- 4003, 1994. ; and

[10409] Muro, A. F.; Marro, M. L.; Gajovic, S.; Porro, F.; Luzzatto, L.; Baralle, F. E. : Mild spherocytic hereditary elliptocytosis and altered levels of alpha- and gamma- adducins in beta- adduc.

[10410] Further studies establishing the function and utilities of ADD2 are found in John Hopkins OMIM database record ID 102681, and in cited publications listed in Table 5, which are hereby incorporated by reference.Adducin 2 (beta) (ADD2, Accession NP_059517.1) is another GAM69 target gene, herein designated TARGET GENE. ADD2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADD2 BINDING SITE, designated SEQ ID:12249, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10411] Another function of GAM69 is therefore inhibition of Ad-

ducin 2 (beta) (ADD2, Accession NP_059517.1), a gene which membrane- cytoskeleton- protein that promotes the assembly of the spectrin- actin network. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD2.

[10412] The function of ADD2 has been established by previous studies. See alpha- adducin (ADD1; 102680). Adducin is a heterodimeric calmodulin (OMIM Ref. No. 114180)- binding protein of the cell- membrane skeleton, which is thought to play a role in assembly of the spectrin- actin lattice that underlies the plasma membrane (see OMIM Ref. No. also 182860 and 102560). Missense mutations in both the alpha- and beta- adducin genes that alter amino acids that are normally phosphorylated have been associated with the regulation of blood pressure in the Milan hypertensive strain (MHS) of rats (Bianchi et al., 1994). [10416] Muro, A. F.; Marro, M. L.; Gajovic, S.; Porro, F.; Luzzatto, L.; Baralle, F. E. : Mild spherocytic hereditary elliptocytosis and altered levels of alpha- and gamma- adducins in beta- adduc.

[10417] Further studies establishing the function and utilities of ADD2 are found in John Hopkins OMIM database record ID 102681, and in cited publications listed in Table 5, which are hereby incorporated by reference.Adducin 2 (beta) (ADD2, Accession NP_059519.1) is another GAM69 target gene, herein designated TARGET GENE. ADD2 BINDING

SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADD2 BINDING SITE, designated SEQ ID:12249, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10418] Another function of GAM69 is therefore inhibition of Adducin 2 (beta) (ADD2, Accession NP_059519.1), a gene which membrane- cytoskeleton- protein that promotes the assembly of the spectrin- actin network. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD2.

[10419] The function of ADD2 has been established by previous studies. See alpha- adducin (ADD1; 102680). Adducin is a heterodimeric calmodulin (OMIM Ref. No. 114180)- binding protein of the cell- membrane skeleton, which is thought to play a role in assembly of the spectrin- actin lattice that underlies the plasma membrane (see OMIM Ref. No. also 182860 and 102560). Missense mutations in both the alpha- and beta- adducin genes that alter amino

acids that are normally phosphorylated have been associated with the regulation of blood pressure in the Milan hypertensive strain (MHS) of rats (Bianchi et al., 1994). Muro et al. (2000) showed that in Add2 - /- mice, targeted disruption of the beta- adducin gene resulted in an 80% decrease of alpha- adducin and a 4- fold upregulation of gamma- adducin in erythrocytes. Elliptocytes, ovalocytes, and occasionally spherocytes were found in the blood smears of - /- mice. Mild hematologic findings were thought to be related to the amount of adducin remaining in the mutant animals (presumably alpha-gamma adducin).

[10420]

[10421] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10422] Bianchi, G.; Tripodi, G.; Casari, G.; Salardi, S.; Barber, B. R.; Garcia, R.; Leoni, P.; Torielli, L.; Cusi, D.; Ferrandi, M.; Pinna, L. A.; Baralle, F. E.; Ferrari, P. : Two point mutations within the adducin genes are involved in blood pressure variation. Proc. Nat. Acad. Sci. 91: 3999- 4003, 1994. ; and

[10423] Muro, A. F.; Marro, M. L.; Gajovic, S.; Porro, F.; Luzzatto,

L.; Baralle, F. E. : Mild spherocytic hereditary elliptocytosis and altered levels of alpha- and gamma- adducins in beta- adduc.

[10424] Further studies establishing the function and utilities of ADD2 are found in John Hopkins OMIM database record ID 102681, and in cited publications listed in Table 5, which are hereby incorporated by reference.Aquaporin 6, kidney specific (AQP6, Accession NP_445738.1) is another GAM69 target gene, herein designated TARGET GENE. AQP6 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by AQP6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE, designated SEQ ID:5241, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10425] Another function of GAM69 is therefore inhibition of Aquaporin 6, kidney specific (AQP6, Accession NP_445738.1), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid- base metabolism. Accordingly, utilities of GAM69 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with AQP6.

[10426] The function of AQP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM51.1.C10orf5 (Accession NP_848931.1) is another GAM69 target gene, herein designated TARGET GENE. C10orf5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C10orf5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C10orf5 BINDING SITE, designated SEQ ID:12344, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10427] Another function of GAM69 is therefore inhibition of C10orf5 (Accession NP_848931.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C10orf5.

[10428] C1orf38 (Accession NP_004839.1) is another GAM69 target gene, herein designated TARGET GENE. C1orf38 BINDING SITE is a target binding site found in the 3` untrans-

lated region of mRNA encoded by C1orf38, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf38 BINDING SITE, designated SEQ ID:17232, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10429] Another function of GAM69 is therefore inhibition of C1orf38 (Accession NP_004839.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf38.

[10430] C1q and tumor necrosis factor related protein 7 (C1QTNF7, Accession NP_114117.1) is another GAM69 target gene, herein designated TARGET GENE. C1QTNF7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1QTNF7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1QTNF7 BINDING SITE, designated SEQ ID:6301, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10431] Another function of GAM69 is therefore inhibition of C1q

and tumor necrosis factor related protein 7 (C1QTNF7, Accession NP_114117.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF7.

[10432] Cyclin b1 (CCNB1, Accession NP_114172.1) is another GAM69 target gene, herein designated TARGET GENE. CCNB1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CCNB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCNB1 BINDING SITE, designated SEQ ID:4167, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10433] Another function of GAM69 is therefore inhibition of Cyclin b1 (CCNB1, Accession NP_114172.1), a gene which essential for the control of the cell cycle at the g2/m (mitosis) transition and may have developmental- and/or cell- type- specific functions. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNB1.

[10434] The function of CCNB1 has been established by previous studies. Pines and Hunter (1989) reported the nucleotide

and predicted amino acid sequence of a human B- type cyclin. The gene is expressed predominantly in the G2/M phase of cell division. The gene product complexes with p34(cdc2) to form the mitosis- promoting factor (MPF). By genetic mapping in the mouse using human cyclin B1 probes, Lock et al. (1992) identified 10 cyclin B1- related sequences located on chromosomes 4, 5, 7, 8, 13, 14, 15, and 17. In Northern analysis, 3 cyclin B1- related transcripts of 1.7, 2.1, and 2.7 kb were detected in embryonic stem cells and postimplantation embryos from day 9.5 to 15.5 of development. The multiple cyclin B1- related sequences in the mouse genome and the multiple cyclin B1 mRNAs raised the possibility that the seemingly redundant cyclin B genes may have developmental- and/or cell-type- specific functions.

[10435] Animal model experiments lend further support to the function of CCNB1. Two B- type cyclins, B1 and B2 (OMIM Ref. No. 602755), have been identified in mammals. Proliferating cells express both cyclins, which bind to and activate p34 (CDC2). To test whether the 2 B- type cyclins have distinct roles, Brandeis et al. (1998) generated lines of transgenic mice, one lacking cyclin B1 and the other lacking B2. Cyclin B1 proved to be an essential gene; no

homozygous B1- null pups were born. In contrast, nullizygous B2 mice developed normally and did not display any obvious abnormalities. Both male and female cyclin B2- null mice were fertile, which was unexpected in view of the high levels and distinct patterns of expression of cyclin B2 during spermatogenesis. Brandeis et al. (1998) showed that the expression of cyclin B1 overlaps the expression of cyclin B2 in the mature testis, but not vice versa. Cyclin B1 can be found both on intracellular membranes and free in the cytoplasm, in contrast to cyclin B2, which is membrane- associated. These observations suggested that cyclin B1 may compensate for the loss of cyclin B2 in the mutant mice, and implies that cyclin B1 is capable of targeting the p34(CDC2) kinase to the essential substrates of cyclin B2.

[10436] It is appreciated that the abovementioned animal model for CCNB1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[10437] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10438] Lock, L. F.; Pines, J.; Hunter, T.; Gilbert, D. J.; Gopalan, G.;

Jenkins, N. A.; Copeland, N. G.; Donovan, P. J. : A single cyclin A gene and multiple cyclin B1- related sequences are dispersed in the mouse genome. Genomics 13: 415-424, 1992. ; and

[10439] Brandeis, M.; Rosewell, I.; Carrington, M.; Crompton, T.; Jacobs, M. A.; Kirk, J.; Gannon, J.; Hunt, T. : Cyclin B2- null mice develop normally and are fertile whereas cyclin B1-null mice.

[10440] Further studies establishing the function and utilities of CCNB1 are found in John Hopkins OMIM database record ID 123836, and in cited publications listed in Table 5, which are hereby incorporated by reference.Calponin 1, basic, smooth muscle (CNN1, Accession NP_001290.2) is another GAM69 target gene, herein designated TARGET GENE. CNN1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CNN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNN1 BINDING SITE, designated SEQ ID:462, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10441] Another function of GAM69 is therefore inhibition of

Calponin 1, basic, smooth muscle (CNN1, Accession NP_001290.2), a gene which is able to inhibit the ATPase activity of myosin and may play a role in smooth muscle contraction. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNN1.

[10442] The function of CNN1 has been established by previous studies. Calponin is a basic 34- kD protein first isolated from chicken gizzard and bovine aorta. It is specifically expressed in smooth muscle and binds calmodulin, actin, and tropomyosin. It is able to inhibit the ATPase activity of myosin and is thought to play a role in smooth muscle contraction. Strasser et al. (1993) isolated 2 similar calponins (h1 and h2) from both mouse and pig. These are the products of separate loci. Northern blots of mouse uterus RNA indicated that h1 transcripts are about 10-fold higher than those of the h2 gene Maguchi et al. (1995) isolated a human cDNA encoding calponin h1 (CNN1) by screening an aorta cDNA library with a rat h1 cDNA. The 297- amino acid CNN1 contains a motif that is tandemly repeated 3 times. The N terminus of CNN1 is markedly basic and highly homologous to that of CNN3 (OMIM Ref. No. 602374). CNN1 has a predicted pI of 9.4.

Northern blot analysis of RNA from human tissues showed that CNN1 is specifically expressed in smooth muscle

[10443]

[10444] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10445] Strasser, P.; Gimona, M.; Moessler, H.; Herzog, M.; Small, J. V. : Mammalian calponin: identification and expression of genetic variants. FEBS Lett. 330: 13- 18, 1993. ; and

[10446] Maguchi, M.; Nishida, W.; Kohara, K.; Kuwano, A.; Kondo, I.; Hiwada, K. : Molecular cloning and gene mapping of human basic and acidic calponins. Biochem. Biophys. Res. Commun. 217: 238- .

[10447] Further studies establishing the function and utilities of CNN1 are found in John Hopkins OMIM database record ID 600806, and in cited publications listed in Table 5, which are hereby incorporated by reference.Collagen, type xi, alpha 2 (COL11A2, Accession NP_542412.1) is another GAM69 target gene, herein designated TARGET GENE. COL11A2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by COL11A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL11A2 BINDING SITE, designated SEQ ID:1273, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10448] Another function of GAM69 is therefore inhibition of Collagen, type xi, alpha 2 (COL11A2, Accession NP_542412.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL11A2.

[10449] Collagen, type xi, alpha 2 (COL11A2, Accession NP_542410.1) is another GAM69 target gene, herein designated TARGET GENE. COL11A2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by COL11A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL11A2 BINDING SITE, designated SEQ ID:1273, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10450] Another function of GAM69 is therefore inhibition of Collagen, type xi, alpha 2 (COL11A2, Accession

NP_542410.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL11A2.

[10451] Collagen, type xi, alpha 2 (COL11A2, Accession NP_542411.1) is another GAM69 target gene, herein designated TARGET GENE. COL11A2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by COL11A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL11A2 BINDING SITE, designated SEQ ID:1273, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10452] Another function of GAM69 is therefore inhibition of Collagen, type xi, alpha 2 (COL11A2, Accession NP_542411.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL11A2.

[10453] Cathepsin e (CTSE, Accession NP_001901.1) is another GAM69 target gene, herein designated TARGET GENE. CTSE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA en-

coded by CTSE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CTSE BINDING SITE, designated SEQ ID:11615, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10454] Another function of GAM69 is therefore inhibition of Cathepsin e (CTSE, Accession NP_001901.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTSE.

[10455] Cytochrome p450, subfamily xxia (steroid 21-hydroxylase, congenital adrenal hyperplasia), polypeptide 2 (CYP21A2, Accession NP_000491.2) is another GAM69 target gene, herein designated TARGET GENE. CYP21A2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CYP21A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP21A2 BINDING SITE, designated SEQ ID:4412, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10456] Another function of GAM69 is therefore inhibition of Cytochrome p450, subfamily xxia (steroid 21-hydroxylase, congenital adrenal hyperplasia), polypeptide 2 (CYP21A2, Accession NP_000491.2), a gene which mediates in cortisol biosynthesis. and therefore is associated with Congenital adrenal hyperplasia (cah) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of Congenital adrenal hyperplasia (cah) ., and of other diseases and clinical conditions associated with CYP21A2.

[10457] The function of CYP21A2 has been established by previous studies. Slominski et al. (1996) presented evidence that the CYP21A2, CYP11A1 (OMIM Ref. No. 118485), CYP17 (OMIM Ref. No. 202110), and ACTHR (OMIM Ref. No. 202200) genes are expressed in skin (see OMIM Ref. No. 202200). The authors suggested that expression of these genes may play a role in skin physiology and pathology and that cutaneous proopiomelanocortin activity may be autoregulated by a feedback mechanism involving glucocorticoids synthesized locally. Thilen and Larsson (1990) performed a retrospective study of all Swedish patients with CAH born between 1969 and 1986, to determine possible benefits of neonatal screening. Information was obtained concerning 67 males and 83 fe-

males. Of these, 143 were regarded as classic and 7 as nonclassic (symptoms after 5 years of age or cryptic). All but 2 (a girl with 11- hydroxylase deficiency and a boy with beta- hydroxysteroid dehydrogenase deficiency) had 21- hydroxylase deficiency. The prevalence was 1 in 11,500. Salt loss was displayed by 93 patients (48 male, 45 female), all before the age of 3 months. The median age at diagnosis for boys in this group was 21 days. Gender assignment was a major problem in 38 of 57 girls, with ambiguous genitalia noticed at birth. Of these girls, 15 were considered to be male before the diagnosis of CAH was made. In a similar study in Kuwait, Lubani et al. (1990) found 60 children with CAH diagnosed between 1978 and 1988, giving an estimated prevalence of 1 in 9,000 live births. In addition, there was presumptive evidence of CAH resulting in the death of 20 other children, giving a prevalence figure of 1 in 7,000. In 54 patients (90%), 21- hydroxylase deficiency was diagnosed; in 3 patients each, the diagnosis was 3- beta- hydroxysteroid dehydrogenase deficiency and 11- beta- hydroxylase deficiency.

[10458] Animal model experiments lend further support to the function of CYP21A2. In the mouse, Chaplin et al. (1986)

showed that only one of the two 21- hydroxylase genes is expressed. The authors presented the complete primary structure of both 21- hydroxylase encoding genes. The active gene in the mouse is referred to as A, whereas in man it is referred to as B. In the mouse, Chaplin et al. (1986) found a deletion of 215 nucleotides spanning the second exon in the 21- hydroxylase B gene; other nucleotide changes introduced frameshifts and premature termination codons. A hybrid gene composed of the 21-hydroxylase B promoter placed 5- prime of the 21- hydroxylase A structural sequences was efficiently transcribed following transfection into adrenocortical tumor cells. These findings demonstrated that the lack of expression was due to mutations within the 21- hydroxylase B structural gene and not due to a defect of the promoter. In the human, the CA21HA gene is a pseudogene (OMIM Ref. No. 184754) and the nature of the gene deletions that prevent expression is different from that in the mouse. Specifically, the 21- hydroxylase A gene has an 8-base deletion within the third exon, introducing a premature termination codon (White et al., 1986; Higashi et al., 1986). See review by White et al. (1987).

[10459] It is appreciated that the abovementioned animal model

for CYP21A2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[10460] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10461] Slominski, A.; Ermak, G.; Mihm, M. : ACTH receptor, CYP11A1, CYP17 and CYP21A2 genes are expressed in skin. J. Clin. Endocr. Metab. 81: 2746- 2749, 1996. ; and

[10462] Thilen, A.; Larsson, A. : Congenital adrenal hyperplasia in Sweden 1969- 1986: prevalence, symptoms and age at diagnosis. Acta Paediat. Scand. 79: 168- 175, 1990.

[10463] Further studies establishing the function and utilities of CYP21A2 are found in John Hopkins OMIM database record ID 201910, and in cited publications listed in Table 5, which are hereby incorporated by reference.D13S106E (Accession NP_005791.2) is another GAM69 target gene, herein designated TARGET GENE. D13S106E BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by D13S106E, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of D13S106E

BINDING SITE, designated SEQ ID:16482, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10464] Another function of GAM69 is therefore inhibition of D13S106E (Accession NP_005791.2) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D13S106E.

[10465] DKFZp547A023 (Accession NP_061174.1) is another GAM69 target gene, herein designated TARGET GENE. DKFZp547A023 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp547A023, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547A023 BINDING SITE, designated SEQ ID:12565, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10466] Another function of GAM69 is therefore inhibition of DKFZp547A023 (Accession NP_061174.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

DKFZp547A023.

[10467] DKFZp761K1423 (Accession NP_060892.1) is another GAM69 target gene, herein designated TARGET GENE. DKFZp761K1423 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZp761K1423, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761K1423 BINDING SITE, designated SEQ ID:9816, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10468] Another function of GAM69 is therefore inhibition of DKFZp761K1423 (Accession NP_060892.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761K1423.

[10469] DMN (Accession NP_663780.1) is another GAM69 target gene, herein designated TARGET GENE. DMN BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DMN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of DMN BINDING SITE, designated SEQ ID:12222, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10470] Another function of GAM69 is therefore inhibition of DMN (Accession NP_663780.1), a gene which may participate in maintaining muscle cell integrity. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMN.

[10471] The function of DMN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.2.DMN (Accession NP_056101.4) is another GAM69 target gene, herein designated TARGET GENE. DMN BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by DMN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DMN BINDING SITE, designated SEQ ID:12222, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10472] Another function of GAM69 is therefore inhibition of DMN

(Accession NP_056101.4), a gene which may participate in maintaining muscle cell integrity. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMN.

[10473] The function of DMN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.2.Docking protein 4 (DOK4, Accession NP_060580.2) is another GAM69 target gene, herein designated TARGET GENE. DOK4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DOK4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DOK4 BINDING SITE, designated SEQ ID:2501, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10474] Another function of GAM69 is therefore inhibition of Docking protein 4 (DOK4, Accession NP_060580.2) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOK4.

[10475] Fibroblast growth factor 18 (FGF18, Accession

NP_003853.1) is another GAM69 target gene, herein designated TARGET GENE. FGF18 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by FGF18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGF18 BINDING SITE, designated SEQ ID:14981, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10476] Another function of GAM69 is therefore inhibition of Fibroblast growth factor 18 (FGF18, Accession NP_003853.1), a gene which stimulates hepatic and intestinal proliferation. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF18.

[10477] The function of FGF18 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM49.1.Fibroblast growth factor 18 (FGF18, Accession NP_387498.1) is another GAM69 target gene, herein designated TARGET GENE. FGF18 BINDING SITE is a target binding site found in the 5` untranslated region of multi-

ple transcripts of mRNA encoded by FGF18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGF18 BINDING SITE, designated SEQ ID:14981, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10478] Another function of GAM69 is therefore inhibition of Fibroblast growth factor 18 (FGF18, Accession NP_387498.1), a gene which stimulates hepatic and intestinal proliferation. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF18.

[10479] The function of FGF18 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM49.1.FLJ10420 (Accession NP_060560.1) is another GAM69 target gene, herein designated TARGET GENE. FLJ10420 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10420, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of FLJ10420 BINDING SITE, designated SEQ ID:6374, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10480] Another function of GAM69 is therefore inhibition of FLJ10420 (Accession NP_060560.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10420.

[10481] FLJ13189 (Accession NP_079158.1) is another GAM69 target gene, herein designated TARGET GENE. FLJ13189 BINDING SITE1 and FLJ13189 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ13189, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13189 BINDING SITE1 and FLJ13189 BINDING SITE2, designated SEQ ID:5952 and SEQ ID:7088 respectively, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10482] Another function of GAM69 is therefore inhibition of FLJ13189 (Accession NP_079158.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13189.

[10483] FLJ21369 (Accession NP_079078.1) is another GAM69 target gene, herein designated TARGET GENE. FLJ21369 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21369, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21369 BINDING SITE, designated SEQ ID:15599, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10484] Another function of GAM69 is therefore inhibition of FLJ21369 (Accession NP_079078.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21369.

[10485] FLJ22843 (Accession NP_079460.2) is another GAM69 target gene, herein designated TARGET GENE. FLJ22843 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ22843, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22843 BINDING SITE, designated SEQ ID:1721, to the nucleotide sequence of GAM69 RNA, herein designated

GAM RNA, also designated SEQ ID:258.

[10486] Another function of GAM69 is therefore inhibition of FLJ22843 (Accession NP_079460.2) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22843.

[10487] FLJ23462 (Accession NP_079119.2) is another GAM69 target gene, herein designated TARGET GENE. FLJ23462 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23462, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23462 BINDING SITE, designated SEQ ID:10577, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10488] Another function of GAM69 is therefore inhibition of FLJ23462 (Accession NP_079119.2) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23462.

[10489] FLJ32214 (Accession NP_689686.1) is another GAM69 target gene, herein designated TARGET GENE. FLJ32214 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ32214, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32214 BINDING SITE, designated SEQ ID:9977, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10490] Another function of GAM69 is therefore inhibition of FLJ32214 (Accession NP_689686.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32214.

[10491] FLJ32915 (Accession NP_659451.1) is another GAM69 target gene, herein designated TARGET GENE. FLJ32915 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ32915, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32915 BINDING SITE, designated SEQ ID:18785, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10492] Another function of GAM69 is therefore inhibition of FLJ32915 (Accession NP_659451.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ32915.

[10493] FLJ35989 (Accession NP_689810.2) is another GAM69 target gene, herein designated TARGET GENE. FLJ35989 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ35989, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ35989 BINDING SITE, designated SEQ ID:8320, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10494] Another function of GAM69 is therefore inhibition of FLJ35989 (Accession NP_689810.2) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ35989.

[10495] FLJ90231 (Accession NP_775852.1) is another GAM69 target gene, herein designated TARGET GENE. FLJ90231 BINDING SITE1 and FLJ90231 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ90231, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ90231 BINDING SITE1 and

FLJ90231 BINDING SITE2, designated SEQ ID:14227 and SEQ ID:8670 respectively, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10496] Another function of GAM69 is therefore inhibition of FLJ90231 (Accession NP_775852.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ90231.

[10497] Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068705.1) is another GAM69 target gene, herein designated TARGET GENE. GABBR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GABBR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:3948, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10498] Another function of GAM69 is therefore inhibition of Gamma-aminobutyric acid (gaba) b receptor, 1 (GABBR1, Accession NP_068705.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with GABBR1.

[10499] Growth arrest-specific 2 like 1 (GAS2L1, Accession NP_689423.1) is another GAM69 target gene, herein designated TARGET GENE. GAS2L1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GAS2L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAS2L1 BINDING SITE, designated SEQ ID:14222, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10500] Another function of GAM69 is therefore inhibition of Growth arrest-specific 2 like 1 (GAS2L1, Accession NP_689423.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAS2L1.

[10501] HAK (Accession NP_443179.1) is another GAM69 target gene, herein designated TARGET GENE. HAK BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HAK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of HAK BINDING SITE, designated SEQ ID:10217, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10502] Another function of GAM69 is therefore inhibition of HAK (Accession NP_443179.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAK.

[10503] Heart and neural crest derivatives expressed 1 (HAND1, Accession NP_004812.1) is another GAM69 target gene, herein designated TARGET GENE. HAND1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HAND1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HAND1 BINDING SITE, designated SEQ ID:12355, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10504] Another function of GAM69 is therefore inhibition of Heart and neural crest derivatives expressed 1 (HAND1, Accession NP_004812.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with HAND1.

[10505] Hepatocyte nuclear factor 4, alpha (HNF4A, Accession NP_849180.1) is another GAM69 target gene, herein designated TARGET GENE. HNF4A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HNF4A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HNF4A BINDING SITE, designated SEQ ID:15282, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10506] Another function of GAM69 is therefore inhibition of Hepatocyte nuclear factor 4, alpha (HNF4A, Accession NP_849180.1), a gene which may be essential for development of the liver, kidney, pancreas and intestine. and therefore may be associated with Type i maturity- onset diabetes of the young. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of Type i maturity- onset diabetes of the young, and of other diseases and clinical conditions associated with HNF4A.

[10507] The function of HNF4A has been established by previous studies. Stoffel and Duncan (1997) investigated the

molecular mechanism by which the Q268X mutation, which deletes 187 C- terminal amino acids of the HNF4-alpha protein, causes diabetes. They showed that the mutant gene product had lost its transcriptional transactivation activity and failed to dimerize and bind DNA, implying that the MODY1 phenotype is due to a loss of HFN4-alpha function. The effect of loss of function on expression of HNF4- alpha target genes was investigated further in embryonic stem cells, which are amenable to genetic manipulation and can be induced to form visceral endoderm. Because the visceral endoderm shares many properties with the liver and pancreatic beta- cells, including expression of genes for glucose transport and metabolism, it offers an ideal system to investigate HNF4-dependent gene regulation in glucose homeostasis. With this approach, Stoffel and Duncan (1997) identified several genes encoding components of the glucose- dependent insulin secretion pathway whose expression is dependent upon HNF4- alpha. These included glucose transporter 2 (OMIM Ref. No. 138160), and the glycolytic enzymes aldolase B (OMIM Ref. No. 229600) and glyceraldehyde- 3- phosphate dehydrogenase (OMIM Ref. No. 138400), and liver pyruvate kinase (OMIM Ref. No.

266200). In addition, they found that expression of the fatty acid binding proteins and cellular retinol binding protein also are downregulated in the absence of HNF4- alpha. These data provided direct evidence that HNF4- alpha is critical for regulating glucose transport and glycolysis and in doing so is critical for maintaining glucose homeostasis.

[10508] Animal model experiments lend further support to the function of HNF4A. To study the contribution of HNF4A to hepatic development and differentiation, Li et al. (2000) used a technique in which Hnf4a - /- mouse embryos were complemented with wildtype visceral endoderm to counteract early embryonic lethality. By histologic analyses, the authors found that specification and early development of the liver and liver morphology did not require Hnf4a. In addition, the expression of many liver genes was unaffected in these mice. However, RT- PCR analysis showed that Hnf4a - /- fetal livers failed to express a large array of genes whose expression in differentiated hepatocytes is essential for a functional hepatic parenchyma, including apolipoproteins (e.g., APOA1; 107680), metabolic proteins (e.g., aldolase B; 229600), transferrin (OMIM Ref. No. 190000), retinol- binding pro-

tein (e.g., RBP4; 180250), and erythropoietin (OMIM Ref. No. 133170). The lack of Hnf4a did not affect the expression of most transcription factors but did significantly reduce the levels of Hnf1a (TCF1; 142410) and the pregnane X receptor (NR1I2; 603065), suggesting that HNF4A acts upstream of at least these 2 transcription factors, which are also important in hepatocyte gene expression.

[10509] It is appreciated that the abovementioned animal model for HNF4A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[10510] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10511] Li, J.; Ning, G.; Duncan, S. A. : Mammalian hepatocyte differentiation requires the transcription factor HNF- 4- alpha. Genes Dev. 14: 464- 474, 2000. ; and

[10512] Stoffel, M.; Duncan, S. A. : The maturity- onset diabetes of the young (MODY1) transcription factor HNF4- alpha regulates expression of genes required for glucose transport and metabolism. P.

[10513] Further studies establishing the function and utilities of HNF4A are found in John Hopkins OMIM database record

ID 600281, and in cited publications listed in Table 5, which are hereby incorporated by reference.Hepatocyte nuclear factor 4, alpha (HNF4A, Accession NP_000448.3) is another GAM69 target gene, herein designated TARGET GENE. HNF4A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HNF4A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HNF4A BINDING SITE, designated SEQ ID:15282, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10514] Another function of GAM69 is therefore inhibition of Hepatocyte nuclear factor 4, alpha (HNF4A, Accession NP_000448.3), a gene which may be essential for development of the liver, kidney, pancreas and intestine. and therefore may be associated with Type i maturity- onset diabetes of the young. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of Type i maturity- onset diabetes of the young, and of other diseases and clinical conditions associated with HNF4A.

[10515] The function of HNF4A has been established by previous

studies. Stoffel and Duncan (1997) investigated the molecular mechanism by which the Q268X mutation, which deletes 187 C- terminal amino acids of the HNF4-alpha protein, causes diabetes. They showed that the mutant gene product had lost its transcriptional transactivation activity and failed to dimerize and bind DNA, implying that the MODY1 phenotype is due to a loss of HFN4-alpha function. The effect of loss of function on expression of HNF4- alpha target genes was investigated further in embryonic stem cells, which are amenable to genetic manipulation and can be induced to form visceral endoderm. Because the visceral endoderm shares many properties with the liver and pancreatic beta- cells, including expression of genes for glucose transport and metabolism, it offers an ideal system to investigate HNF4-dependent gene regulation in glucose homeostasis. With this approach, Stoffel and Duncan (1997) identified several genes encoding components of the glucose- dependent insulin secretion pathway whose expression is dependent upon HNF4- alpha. These included glucose transporter 2 (OMIM Ref. No. 138160), and the glycolytic enzymes aldolase B (OMIM Ref. No. 229600) and glyceraldehyde- 3- phosphate dehydrogenase (OMIM Ref. No.

138400), and liver pyruvate kinase (OMIM Ref. No. 266200). In addition, they found that expression of the fatty acid binding proteins and cellular retinol binding protein also are downregulated in the absence of HNF4-alpha. These data provided direct evidence that HNF4- alpha is critical for regulating glucose transport and glycolysis and in doing so is critical for maintaining glucose homeostasis.

[10516] Animal model experiments lend further support to the function of HNF4A. To study the contribution of HNF4A to hepatic development and differentiation, Li et al. (2000) used a technique in which Hnf4a - /- mouse embryos were complemented with wildtype visceral endoderm to counteract early embryonic lethality. By histologic analyses, the authors found that specification and early development of the liver and liver morphology did not require Hnf4a. In addition, the expression of many liver genes was unaffected in these mice. However, RT- PCR analysis showed that Hnf4a - /- fetal livers failed to express a large array of genes whose expression in differentiated hepatocytes is essential for a functional hepatic parenchyma, including apolipoproteins (e.g., APOA1; 107680), metabolic proteins (e.g., aldolase B; 229600),

transferrin (OMIM Ref. No. 190000), retinol- binding protein (e.g., RBP4; 180250), and erythropoietin (OMIM Ref. No. 133170). The lack of Hnf4a did not affect the expression of most transcription factors but did significantly reduce the levels of Hnf1a (TCF1; 142410) and the pregnane X receptor (NR1I2; 603065), suggesting that HNF4A acts upstream of at least these 2 transcription factors, which are also important in hepatocyte gene expression.

[10517] It is appreciated that the abovementioned animal model for HNF4A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[10518] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10519] Li, J.; Ning, G.; Duncan, S. A. : Mammalian hepatocyte differentiation requires the transcription factor HNF- 4- alpha. Genes Dev. 14: 464- 474, 2000. ; and

[10520] Stoffel, M.; Duncan, S. A. : The maturity- onset diabetes of the young (MODY1) transcription factor HNF4- alpha regulates expression of genes required for glucose transport and metabolism. P.

[10521] Further studies establishing the function and utilities of

HNF4A are found in John Hopkins OMIM database record ID 600281, and in cited publications listed in Table 5, which are hereby incorporated by reference.Homeo box b6 (HOXB6, Accession NP_724778.1) is another GAM69 target gene, herein designated TARGET GENE. HOXB6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HOXB6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXB6 BINDING SITE, designated SEQ ID:8188, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10522] Another function of GAM69 is therefore inhibition of Homeo box b6 (HOXB6, Accession NP_724778.1), a gene which participates in establishing segmentation patterns and in determining segment identities. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB6.

[10523] The function of HOXB6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM48.2.HRD1 (Accession NP_115807.1) is another GAM69 target gene, herein designated TARGET GENE. HRD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HRD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HRD1 BINDING SITE, designated SEQ ID:1224, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10524] Another function of GAM69 is therefore inhibition of HRD1 (Accession NP_115807.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRD1.

[10525] HRD1 (Accession NP_757385.1) is another GAM69 target gene, herein designated TARGET GENE. HRD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by HRD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HRD1 BINDING SITE, designated SEQ ID:1224, to the nucleotide sequence of GAM69 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:258.

[10526] Another function of GAM69 is therefore inhibition of HRD1 (Accession NP_757385.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRD1.

[10527] Insulin-like growth factor 1 (somatomedin c) (IGF1, Accession NP_000609.1) is another GAM69 target gene, herein designated TARGET GENE. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGF1 BINDING SITE, designated SEQ ID:11594, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10528] Another function of GAM69 is therefore inhibition of Insulin-like growth factor 1 (somatomedin c) (IGF1, Accession NP_000609.1), a gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore may be associated with Growth retardation with sensorineural deafness and mental retardation. Accordingly, utilities of GAM69

include diagnosis, prevention and treatment of Growth retardation with sensorineural deafness and mental retardation, and of other diseases and clinical conditions associated with IGF1.

[10529] The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.2.Potassium voltage-gated channel, shaker-related subfamily, member 3 (KCNA3, Accession NP_002223.2) is another GAM69 target gene, herein designated TARGET GENE. KCNA3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KCNA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNA3 BINDING SITE, designated SEQ ID:11200, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10530] Another function of GAM69 is therefore inhibition of Potassium voltage-gated channel, shaker-related subfamily, member 3 (KCNA3, Accession NP_002223.2) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with KCNA3.

[10531] Potassium voltage-gated channel, isk-related family, member 2 (KCNE2, Accession NP_751951.1) is another GAM69 target gene, herein designated TARGET GENE. KCNE2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KCNE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNE2 BINDING SITE, designated SEQ ID:9124, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10532] Another function of GAM69 is therefore inhibition of Potassium voltage-gated channel, isk-related family, member 2 (KCNE2, Accession NP_751951.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNE2.

[10533] KIAA0082 (Accession NP_055865.1) is another GAM69 target gene, herein designated TARGET GENE. KIAA0082 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0082, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0082 BINDING SITE, designated SEQ ID:6751, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10534] Another function of GAM69 is therefore inhibition of KIAA0082 (Accession NP_055865.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0082.

[10535] KIAA0084 (Accession XP_042841.3) is another GAM69 target gene, herein designated TARGET GENE. KIAA0084 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0084, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0084 BINDING SITE, designated SEQ ID:16667, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10536] Another function of GAM69 is therefore inhibition of KIAA0084 (Accession XP_042841.3) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KIAA0084.

[10537] KIAA0872 (Accession NP_055755.1) is another GAM69 target gene, herein designated TARGET GENE. KIAA0872 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0872, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0872 BINDING SITE, designated SEQ ID:17704, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10538] Another function of GAM69 is therefore inhibition of KIAA0872 (Accession NP_055755.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0872.

[10539] KIAA1018 (Accession NP_055782.1) is another GAM69 target gene, herein designated TARGET GENE. KIAA1018 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1018, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA1018 BINDING SITE, designated SEQ ID:7543, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10540] Another function of GAM69 is therefore inhibition of KIAA1018 (Accession NP_055782.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1018.

[10541] Kallikrein 14 (KLK14, Accession NP_071329.1) is another GAM69 target gene, herein designated TARGET GENE. KLK14 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KLK14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLK14 BINDING SITE, designated SEQ ID:19306, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10542] Another function of GAM69 is therefore inhibition of Kallikrein 14 (KLK14, Accession NP_071329.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with KLK14.

[10543] L(3)mbt-like (drosophila) (L3MBTL, Accession NP_115479.2) is another GAM69 target gene, herein designated TARGET GENE. L3MBTL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by L3MBTL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of L3MBTL BINDING SITE, designated SEQ ID:3613, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10544] Another function of GAM69 is therefore inhibition of L(3)mbt-like (drosophila) (L3MBTL, Accession NP_115479.2) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with L3MBTL.

[10545] LOC116238 (Accession NP_612472.1) is another GAM69 target gene, herein designated TARGET GENE. LOC116238 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC116238, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC116238 BINDING SITE, designated SEQ ID:7565, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10546] Another function of GAM69 is therefore inhibition of LOC116238 (Accession NP_612472.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116238.

[10547] LOC133491 (Accession XP_059655.2) is another GAM69 target gene, herein designated TARGET GENE. LOC133491 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC133491, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC133491 BINDING SITE, designated SEQ ID:19039, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10548] Another function of GAM69 is therefore inhibition of LOC133491 (Accession XP_059655.2) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC133491.

[10549] LOC143308 (Accession XP_096411.1) is another GAM69 target gene, herein designated TARGET GENE. LOC143308 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC143308, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143308 BINDING SITE, designated SEQ ID:7544, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10550] Another function of GAM69 is therefore inhibition of LOC143308 (Accession XP_096411.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143308.

[10551] LOC148490 (Accession XP_086210.2) is another GAM69 target gene, herein designated TARGET GENE. LOC148490 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148490, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC148490 BINDING SITE, designated SEQ ID:14446, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10552] Another function of GAM69 is therefore inhibition of LOC148490 (Accession XP_086210.2) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148490.

[10553] LOC150935 (Accession XP_087049.1) is another GAM69 target gene, herein designated TARGET GENE. LOC150935 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150935, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150935 BINDING SITE, designated SEQ ID:5653, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10554] Another function of GAM69 is therefore inhibition of LOC150935 (Accession XP_087049.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150935.

[10555] LOC196993 (Accession XP_116971.3) is another GAM69 target gene, herein designated TARGET GENE. LOC196993 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC196993, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196993 BINDING SITE, designated SEQ ID:12012, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10556] Another function of GAM69 is therefore inhibition of LOC196993 (Accession XP_116971.3) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196993.

[10557] LOC201175 (Accession NP_777579.1) is another GAM69 target gene, herein designated TARGET GENE. LOC201175 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC201175, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201175 BINDING SITE, designated SEQ ID:5222, to

the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10558] Another function of GAM69 is therefore inhibition of LOC201175 (Accession NP_777579.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201175.

[10559] LOC201292 (Accession NP_775818.1) is another GAM69 target gene, herein designated TARGET GENE. LOC201292 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC201292, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201292 BINDING SITE, designated SEQ ID:4960, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10560] Another function of GAM69 is therefore inhibition of LOC201292 (Accession NP_775818.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201292.

[10561] LOC283259 (Accession XP_208061.3) is another GAM69

target gene, herein designated TARGET GENE. LOC283259 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283259, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283259 BINDING SITE, designated SEQ ID:14650, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10562] Another function of GAM69 is therefore inhibition of LOC283259 (Accession XP_208061.3) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283259.

[10563] LOC283487 (Accession XP_211062.1) is another GAM69 target gene, herein designated TARGET GENE. LOC283487 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC283487, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283487 BINDING SITE, designated SEQ ID:10763, to the nucleotide sequence of

GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10564] Another function of GAM69 is therefore inhibition of LOC283487 (Accession XP_211062.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283487.

[10565] LOC283778 (Accession XP_211199.1) is another GAM69 target gene, herein designated TARGET GENE. LOC283778 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283778, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283778 BINDING SITE, designated SEQ ID:7820, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10566] Another function of GAM69 is therefore inhibition of LOC283778 (Accession XP_211199.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283778.

[10567] LOC283888 (Accession XP_211249.1) is another GAM69

target gene, herein designated TARGET GENE. LOC283888 BINDING SITE1 and LOC283888 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC283888, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283888 BINDING SITE1 and LOC283888 BINDING SITE2, designated SEQ ID:19540 and SEQ ID:4070 respectively, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10568] Another function of GAM69 is therefore inhibition of LOC283888 (Accession XP_211249.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283888.

[10569] LOC284191 (Accession XP_211377.1) is another GAM69 target gene, herein designated TARGET GENE. LOC284191 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284191, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC284191 BINDING SITE, designated SEQ ID:6369, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10570] Another function of GAM69 is therefore inhibition of LOC284191 (Accession XP_211377.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284191.

[10571] LOC284352 (Accession XP_113978.1) is another GAM69 target gene, herein designated TARGET GENE. LOC284352 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284352, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284352 BINDING SITE, designated SEQ ID:13773, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10572] Another function of GAM69 is therefore inhibition of LOC284352 (Accession XP_113978.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284352.

[10573] LOC284748 (Accession XP_211629.1) is another GAM69 target gene, herein designated TARGET GENE. LOC284748 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284748, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284748 BINDING SITE, designated SEQ ID:6746, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10574] Another function of GAM69 is therefore inhibition of LOC284748 (Accession XP_211629.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284748.

[10575] LOC284907 (Accession XP_209397.1) is another GAM69 target gene, herein designated TARGET GENE. LOC284907 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284907, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284907 BINDING SITE, designated SEQ ID:20140, to

the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10576] Another function of GAM69 is therefore inhibition of LOC284907 (Accession XP_209397.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284907.

[10577] LOC284960 (Accession XP_211715.1) is another GAM69 target gene, herein designated TARGET GENE. LOC284960 BINDING SITE1 and LOC284960 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC284960, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284960 BINDING SITE1 and LOC284960 BINDING SITE2, designated SEQ ID:13185 and SEQ ID:6769 respectively, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10578] Another function of GAM69 is therefore inhibition of LOC284960 (Accession XP_211715.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC284960.

[10579] LOC285014 (Accession XP_211734.1) is another GAM69 target gene, herein designated TARGET GENE. LOC285014 BINDING SITE1 and LOC285014 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC285014, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285014 BINDING SITE1 and LOC285014 BINDING SITE2, designated SEQ ID:13185 and SEQ ID:6769 respectively, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10580] Another function of GAM69 is therefore inhibition of LOC285014 (Accession XP_211734.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285014.

[10581] LOC285032 (Accession XP_211740.1) is another GAM69 target gene, herein designated TARGET GENE. LOC285032 BINDING SITE1 and LOC285032 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC285032, corresponding to target binding

sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285032 BINDING SITE1 and LOC285032 BINDING SITE2, designated SEQ ID:13185 and SEQ ID:6769 respectively, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10582] Another function of GAM69 is therefore inhibition of LOC285032 (Accession XP_211740.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285032.

[10583] LOC285045 (Accession XP_211744.1) is another GAM69 target gene, herein designated TARGET GENE. LOC285045 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285045 BINDING SITE, designated SEQ ID:5718, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10584] Another function of GAM69 is therefore inhibition of

LOC285045 (Accession XP_211744.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285045.

[10585] LOC285594 (Accession XP_211946.2) is another GAM69 target gene, herein designated TARGET GENE. LOC285594 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285594, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285594 BINDING SITE, designated SEQ ID:8400, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10586] Another function of GAM69 is therefore inhibition of LOC285594 (Accession XP_211946.2) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285594.

[10587] LOC285767 (Accession XP_212019.1) is another GAM69 target gene, herein designated TARGET GENE. LOC285767 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285767, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285767 BINDING SITE, designated SEQ ID:18052, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10588] Another function of GAM69 is therefore inhibition of LOC285767 (Accession XP_212019.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285767.

[10589] LOC285846 (Accession XP_209776.1) is another GAM69 target gene, herein designated TARGET GENE. LOC285846 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285846, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285846 BINDING SITE, designated SEQ ID:6565, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10590] Another function of GAM69 is therefore inhibition of LOC285846 (Accession XP_209776.1) . Accordingly, utili-

ties of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285846.

[10591] LOC286008 (Accession XP_212134.1) is another GAM69 target gene, herein designated TARGET GENE. LOC286008 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC286008, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286008 BINDING SITE, designated SEQ ID:18326, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10592] Another function of GAM69 is therefore inhibition of LOC286008 (Accession XP_212134.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286008.

[10593] LOC339505 (Accession XP_294985.1) is another GAM69 target gene, herein designated TARGET GENE. LOC339505 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339505, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339505 BINDING SITE, designated SEQ ID:3748, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10594] Another function of GAM69 is therefore inhibition of LOC339505 (Accession XP_294985.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339505.

[10595] LOC339685 (Accession XP_295032.1) is another GAM69 target gene, herein designated TARGET GENE. LOC339685 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339685, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339685 BINDING SITE, designated SEQ ID:7222, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10596] Another function of GAM69 is therefore inhibition of LOC339685 (Accession XP_295032.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC339685.

[10597] LOC340561 (Accession XP_291337.1) is another GAM69 target gene, herein designated TARGET GENE. LOC340561 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC340561, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340561 BINDING SITE, designated SEQ ID:7740, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10598] Another function of GAM69 is therefore inhibition of LOC340561 (Accession XP_291337.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340561.

[10599] LOC347867 (Accession XP_300269.1) is another GAM69 target gene, herein designated TARGET GENE. LOC347867 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC347867, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC347867 BINDING SITE, designated SEQ ID:14650, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10600] Another function of GAM69 is therefore inhibition of LOC347867 (Accession XP_300269.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC347867.

[10601] LOC347929 (Accession XP_302565.1) is another GAM69 target gene, herein designated TARGET GENE. LOC347929 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC347929, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC347929 BINDING SITE, designated SEQ ID:8274, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10602] Another function of GAM69 is therefore inhibition of LOC347929 (Accession XP_302565.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC347929.

[10603] LOC348483 (Accession XP_290913.2) is another GAM69 target gene, herein designated TARGET GENE. LOC348483 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348483, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348483 BINDING SITE, designated SEQ ID:6566, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10604] Another function of GAM69 is therefore inhibition of LOC348483 (Accession XP_290913.2) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348483.

[10605] LOC348808 (Accession XP_302893.1) is another GAM69 target gene, herein designated TARGET GENE. LOC348808 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348808, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC348808 BINDING SITE, designated SEQ ID:1722, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10606] Another function of GAM69 is therefore inhibition of LOC348808 (Accession XP_302893.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348808.

[10607] LOC349092 (Accession XP_302959.1) is another GAM69 target gene, herein designated TARGET GENE. LOC349092 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC349092, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349092 BINDING SITE, designated SEQ ID:9734, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10608] Another function of GAM69 is therefore inhibition of LOC349092 (Accession XP_302959.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349092.

[10609] LOC349272 (Accession XP_303013.1) is another GAM69 target gene, herein designated TARGET GENE. LOC349272 BINDING SITE1 and LOC349272 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC349272, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349272 BINDING SITE1 and LOC349272 BINDING SITE2, designated SEQ ID:11989 and SEQ ID:4719 respectively, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10610] Another function of GAM69 is therefore inhibition of LOC349272 (Accession XP_303013.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349272.

[10611] LOC349279 (Accession XP_303015.1) is another GAM69 target gene, herein designated TARGET GENE. LOC349279 BINDING SITE1 and LOC349279 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC349279, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349279 BINDING SITE1 and LOC349279 BINDING SITE2, designated SEQ ID:7545 and SEQ ID:4719 respectively, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10612] Another function of GAM69 is therefore inhibition of LOC349279 (Accession XP_303015.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349279.

[10613] LOC349301 (Accession XP_303022.1) is another GAM69 target gene, herein designated TARGET GENE. LOC349301 BINDING SITE1 and LOC349301 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC349301, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349301 BINDING SITE1 and LOC349301 BINDING SITE2, designated SEQ ID:11989 and SEQ ID:4719 respectively, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10614] Another function of GAM69 is therefore inhibition of LOC349301 (Accession XP_303022.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349301.

[10615] LOC349306 (Accession XP_303023.1) is another GAM69 target gene, herein designated TARGET GENE. LOC349306 BINDING SITE1 and LOC349306 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC349306, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC349306 BINDING SITE1 and LOC349306 BINDING SITE2, designated SEQ ID:11989 and SEQ ID:4719 respectively, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10616] Another function of GAM69 is therefore inhibition of LOC349306 (Accession XP_303023.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC349306.

[10617] LOC92568 (Accession XP_045852.1) is another GAM69

target gene, herein designated TARGET GENE. LOC92568 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92568, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92568 BINDING SITE, designated SEQ ID:6853, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10618] Another function of GAM69 is therefore inhibition of LOC92568 (Accession XP_045852.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92568.

[10619] LSM1 (Accession NP_055277.1) is another GAM69 target gene, herein designated TARGET GENE. LSM1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LSM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LSM1 BINDING SITE, designated SEQ ID:11524, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also

designated SEQ ID:258.

[10620] Another function of GAM69 is therefore inhibition of LSM1 (Accession NP_055277.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LSM1.

[10621] Methyl cpg binding protein 2 (rett syndrome) (MECP2, Accession NP_004983.1) is another GAM69 target gene, herein designated TARGET GENE. MECP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MECP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MECP2 BINDING SITE, designated SEQ ID:15395, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10622] Another function of GAM69 is therefore inhibition of Methyl cpg binding protein 2 (rett syndrome) (MECP2, Accession NP_004983.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MECP2.

[10623] MGC11332 (Accession NP_116107.2) is another GAM69 target gene, herein designated TARGET GENE. MGC11332

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC11332, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC11332 BINDING SITE, designated SEQ ID:3597, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10624] Another function of GAM69 is therefore inhibition of MGC11332 (Accession NP_116107.2) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11332.

[10625] MGC12335 (Accession NP_116133.1) is another GAM69 target gene, herein designated TARGET GENE. MGC12335 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC12335, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC12335 BINDING SITE, designated SEQ ID:12974, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10626] Another function of GAM69 is therefore inhibition of MGC12335 (Accession NP_116133.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12335.

[10627] MGC42638 (Accession NP_848662.1) is another GAM69 target gene, herein designated TARGET GENE. MGC42638 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC42638, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC42638 BINDING SITE, designated SEQ ID:7740, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10628] Another function of GAM69 is therefore inhibition of MGC42638 (Accession NP_848662.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC42638.

[10629] Muscle ras oncogene homolog (MRAS, Accession NP_036351.1) is another GAM69 target gene, herein designated TARGET GENE. MRAS BINDING SITE is a target

binding site found in the 5` untranslated region of mRNA encoded by MRAS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRAS BINDING SITE, designated SEQ ID:17599, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10630] Another function of GAM69 is therefore inhibition of Muscle ras oncogene homolog (MRAS, Accession NP_036351.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRAS.

[10631] Nad(p)h dehydrogenase, quinone 2 (NQO2, Accession NP_000895.1) is another GAM69 target gene, herein designated TARGET GENE. NQO2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NQO2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NQO2 BINDING SITE, designated SEQ ID:17356, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10632] Another function of GAM69 is therefore inhibition of

Nad(p)h dehydrogenase, quinone 2 (NQO2, Accession NP_000895.1), a gene which oxidizes NADH or NADPH by quinones and oxidation- reduction dyes. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NQO2.

[10633] The function of NQO2 has been established by previous studies. NAD(P)H:quinone oxidoreductases (NQOs) are flavoproteins that catalyze the oxidation of NADH or NADPH by various quinones and oxidation- reduction dyes. Jaiswal et al. (1988) described a cDNA that encodes a dioxin- inducible cytosolic form of human NAD(P)H:quinone oxidoreductase (NQO1; 125860). Jaiswal et al. (1990) described the nucleotide sequence and deduced amino acid sequence for a cDNA clone that encodes a second form of this oxidoreductase, NQO2. It was isolated by screening a human liver cDNA library by hybridization with an NQO1 cDNA probe. The NQO2 cDNA was 976 nucleotides long and encoded a protein of 231 amino acids with a molecular mass of 25,956. The human NQO2 cDNA and protein were 54% and 49% similar to human liver cytosolic NQO1 cDNA and protein, respectively. Southern blot analysis suggested the presence of a single

human gene approximately 14 to 17 kb long. The NQO2 gene showed extensive polymorphism. By study of rodent/human somatic cell hybrids, Jaiswal et al. (1990) mapped the NQO2 gene to 6pter- q12. By fluorescence in situ hybridization, Jaiswal et al. (1999) narrowed the mapping of NQO2 to 6p25.

[10634]

[10635] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10636] Jaiswal, A. K.; Bell, D. W.; Radjendirane, V.; Testa, J. R. : Localization of human NQO1 gene to chromosome 16q22 and NQO2- 6p25 and associated polymorphisms. Pharmacogenetics 9: 413- 418, 1999. ; and

[10637] Jaiswal, A. K.; Burnett, P.; Adesnik, M.; McBride, O. W. : Nucleotide and deduced amino acid sequence of a human cDNA (NQO2) corresponding to a second member of the NAD(P)H:quinone oxi.

[10638] Further studies establishing the function and utilities of NQO2 are found in John Hopkins OMIM database record ID 160998, and in cited publications listed in Table 5, which are hereby incorporated by reference.Nuclear receptor subfamily 3, group c, member 2 (NR3C2, Accession

NP_000892.1) is another GAM69 target gene, herein designated TARGET GENE. NR3C2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NR3C2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NR3C2 BINDING SITE, designated SEQ ID:18170, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10639] Another function of GAM69 is therefore inhibition of Nuclear receptor subfamily 3, group c, member 2 (NR3C2, Accession NP_000892.1), a gene which is to increase ion and water transport and thus raise extracellular fluid volume and blood pressure and lower potassium levels. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR3C2.

[10640] The function of NR3C2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.p100 (Accession NP_055205.1) is another GAM69 target gene, herein designated TARGET GENE. p100 BINDING SITE is a target binding site found in the 3`

untranslated region of mRNA encoded by p100, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of p100 BINDING SITE, designated SEQ ID:7791, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10641] Another function of GAM69 is therefore inhibition of p100 (Accession NP_055205.1), a gene which coactivates gene expression regulated by the Epstein- Barr virus nuclear antigen 2 . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with p100.

[10642] The function of p100 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.P21/cdc42/rac1-activated kinase 1 (ste20 homolog, yeast) (PAK1, Accession NP_002567.2) is another GAM69 target gene, herein designated TARGET GENE. PAK1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PAK1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of PAK1 BINDING SITE, designated SEQ ID:4638, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10643] Another function of GAM69 is therefore inhibition of P21/cdc42/rac1-activated kinase 1 (ste20 homolog, yeast) (PAK1, Accession NP_002567.2), a gene which activates the Jun N- terminal kinase MAP kinase pathway. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK1.

[10644] The function of PAK1 has been established by previous studies. PAK1 protein promotes the disassembly of stress fibers and focal adhesions. Sanders et al. (1999) demonstrated that, in baby hamster kidney- 21 and HeLa cells expressing constitutively active PAK1, MLCK (OMIM Ref. No. 600922) activity and myosin light- chain phosphorylation were decreased, and cell spreading was inhibited. These results indicated that MLCK is a target for PAK1, and that PAKs may regulate cytoskeletal dynamics by decreasing MLCK activity and myosin light- chain phosphorylation. Parrini et al. (2002) showed that PAK1 forms homodimers in vivo and that its dimerization is regulated by

the intracellular level of GTP- CDC42 (OMIM Ref. No. 116952) or GTP- RAC1 (OMIM Ref. No. 602048). The dimerized PAK1 adopts a trans- inhibited conformation: the N- terminal inhibitory portion of one PAK1 molecule in the dimer binds and inhibits the catalytic domain of the other. One GTPase interaction can result in activation of both partners. Another ligand, beta- PIX (OMIM Ref. No. 605477), can stably associate with dimerized PAK1. Dimerization does not facilitate PAK1 trans- phosphorylation. The authors concluded that the functional significance of dimerization is to allow trans- inhibition. Vadlamudi et al. (2002) identified filamin A (FLNA; 300017) as a binding partner of PAK1 in a yeast 2- hybrid screen of a mammary gland cDNA library. By mutation analysis, they localized the PAK1- binding region in FLNA to tandem repeat 23 in the C terminus, and the FLNA- binding region in PAK1 between amino acids 52 and 132 in the conserved CDC42 (OMIM Ref. No. 116952)/RAC (OMIM Ref. No. 602048)- interacting domain. Endogenous FLNA was phosphorylated by PAK1 on ser2152 following stimulation with physiologic signaling molecules. Following stimulation, FLNA colocalized with PAK1 in membrane ruffles. The ruffle- forming activity of PAK1 was found in FLNA-

expressing cells, but not in cells deficient in FLNA.

[10645]

[10646] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10647] Sanders, L. C.; Matsumura, F.; Bokoch, G. M.; de Lanerolle, P. : Inhibition of myosin light chain kinase by p21- activated kinase. Science 283: 2083- 2085, 1999. ; and

[10648] Vadlamudi, R. K.; Li, F.; Adam, L.; Nguyen, D.; Ohta, Y.; Stossel, T. P.; Kumar, R. : Filamin is essential in actin cytoskeletal assembly mediated by p21- activated kinase 1. Nature Cell.

[10649] Further studies establishing the function and utilities of PAK1 are found in John Hopkins OMIM database record ID 601032, and in cited publications listed in Table 5, which are hereby incorporated by reference.Platelet-derived growth factor beta polypeptide (simian sarcoma viral (v-sis) oncogene homolog) (PDGFB, Accession NP_148937.1) is another GAM69 target gene, herein designated TARGET GENE. PDGFB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PDGFB, corresponding to a target binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDGFB BINDING SITE, designated SEQ ID:6199, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10650] Another function of GAM69 is therefore inhibition of Platelet-derived growth factor beta polypeptide (simian sarcoma viral (v-sis) oncogene homolog) (PDGFB, Accession NP_148937.1), a gene which plays an important role in stimulating adjacent cells to grow and thereby heal the wound. and therefore may be associated with Dermatofibrosarcoma protuberans (dp). Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of Dermatofibrosarcoma protuberans (dp)., and of other diseases and clinical conditions associated with PDGFB.

[10651] The function of PDGFB has been established by previous studies. Most proliferating cells are programmed to undergo apoptosis unless specific survival signals are provided. Platelet- derived growth factor promotes cellular proliferation and inhibits apoptosis. Romashkova and Makarov (1999) showed that PDGF activates the RAS/ PIK3/AKT1/IKK/NFKB1 pathway. In this pathway, NFKB1 (OMIM Ref. No. 164011) does not induce c- myc and

apoptosis, but instead induces putative antiapoptotic genes. In response to PDGF, AKT1 (OMIM Ref. No. 164730) transiently associates with IKK (see OMIM Ref. No. 600664) and induces IKK activation. The authors suggested that under certain conditions PIK3 (see OMIM Ref. No. 171834) may activate NFKB1 without the involvement of NFKBIA (OMIM Ref. No. 164008) or NFKBIB (OMIM Ref. No. 604495) degradation. Dermatofibrosarcoma protuberans (DFSP), an infiltrative skin tumor of intermediate malignancy, presents specific cytogenetic features such as reciprocal translocations t(17;22)(q22;q13) and supernumerary ring chromosomes derived from t(17;22). Simon et al. (1997) characterized the breakpoints from translocations and rings in dermatofibrosarcoma protuberans and its juvenile form, giant cell fibroblastoma, on the genomic and RNA levels. They found that these rearrangements fuse the PDGFB gene and the COL1A1 gene (OMIM Ref. No. 120150). Simon et al. (1997) commented that PDGFB has transforming activity and is a potent mitogen for a number of cell types, but its role in oncogenic processes was not fully understood. They noted that neither COL1A1 nor PDGFB had hitherto been implicated in tumor translocations. The gene fusions deleted exon 1 of PDGFB and

released this growth factor from its normal regulation; see 190040.0002.

[10652]

[10653] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10656] Further studies establishing the function and utilities of PDGFB are found in John Hopkins OMIM database record ID 190040, and in cited publications listed in Table 5, which are hereby incorporated by refer-ence.Platelet-derived growth factor beta polypeptide

(simian sarcoma viral (v-sis) oncogene homolog) (PDGFB, Accession NP_002599.1) is another GAM69 target gene, herein designated TARGET GENE. PDGFB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PDGFB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDGFB BINDING SITE, designated SEQ ID:6199, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10657] Another function of GAM69 is therefore inhibition of Platelet-derived growth factor beta polypeptide (simian sarcoma viral (v-sis) oncogene homolog) (PDGFB, Accession NP_002599.1), a gene which plays an important role in stimulating adjacent cells to grow and thereby heal the wound. and therefore may be associated with Dermatofibrosarcoma protuberans (dp). Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of Dermatofibrosarcoma protuberans (dp)., and of other diseases and clinical conditions associated with PDGFB.

[10658] The function of PDGFB has been established by previous studies. Most proliferating cells are programmed to un-

dergo apoptosis unless specific survival signals are provided. Platelet- derived growth factor promotes cellular proliferation and inhibits apoptosis. Romashkova and Makarov (1999) showed that PDGF activates the RAS/PIK3/AKT1/IKK/NFKB1 pathway. In this pathway, NFKB1 (OMIM Ref. No. 164011) does not induce c- myc and apoptosis, but instead induces putative antiapoptotic genes. In response to PDGF, AKT1 (OMIM Ref. No. 164730) transiently associates with IKK (see OMIM Ref. No. 600664) and induces IKK activation. The authors suggested that under certain conditions PIK3 (see OMIM Ref. No. 171834) may activate NFKB1 without the involvement of NFKBIA (OMIM Ref. No. 164008) or NFKBIB (OMIM Ref. No. 604495) degradation. Dermatofibrosarcoma protuberans (DFSP), an infiltrative skin tumor of intermediate malignancy, presents specific cytogenetic features such as reciprocal translocations t(17;22)(q22;q13) and supernumerary ring chromosomes derived from t(17;22). Simon et al. (1997) characterized the breakpoints from translocations and rings in dermatofibrosarcoma protuberans and its juvenile form, giant cell fibroblastoma, on the genomic and RNA levels. They found that these rearrangements fuse the PDGFB gene and the COL1A1 gene (OMIM Ref.

No. 120150). Simon et al. (1997) commented that PDGFB has transforming activity and is a potent mitogen for a number of cell types, but its role in oncogenic processes was not fully understood. They noted that neither COL1A1 nor PDGFB had hitherto been implicated in tumor translocations. The gene fusions deleted exon 1 of PDGFB and released this growth factor from its normal regulation; see 190040.0002.

[10659]

[10660] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10661] Simon, M.- P.; Pedeutour, F.; Sirvent, N.; Grosgeorge, J.; Minoletti, F.; Coindre, J.- M.; Terrier- Lacombe, M.- J.; Mandahl, N.; Craver, R. [10663] Further studies establishing the function and utilities of PDGFB are found in John Hopkins OMIM database record ID 190040, and in cited publications listed in Table 5, which are hereby incorporated by reference.PRO2015 (Accession NP_060982.1) is another GAM69 target gene, herein designated TARGET GENE. PRO2015 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO2015, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO2015 BINDING SITE, designated SEQ ID:18651, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10664] Another function of GAM69 is therefore inhibition of PRO2015 (Accession NP_060982.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2015.

[10665] Protein z, vitamin k-dependent plasma glycoprotein (PROZ, Accession NP_003882.1) is another GAM69 target gene, herein designated TARGET GENE. PROZ BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by PROZ, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PROZ BINDING SITE, designated SEQ ID:10472, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10666] Another function of GAM69 is therefore inhibition of Protein z, vitamin k-dependent plasma glycoprotein (PROZ, Accession NP_003882.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROZ.

[10667] Ptk7 protein tyrosine kinase 7 (PTK7, Accession NP_690622.1) is another GAM69 target gene, herein designated TARGET GENE. PTK7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTK7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTK7 BINDING SITE, designated SEQ ID:14002, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10668] Another function of GAM69 is therefore inhibition of Ptk7 protein tyrosine kinase 7 (PTK7, Accession NP_690622.1), a gene which is a glycosylated receptor protein tyrosine kinase and may function as a cell adhesion molecule. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK7.

[10669] The function of PTK7 has been established by previous studies. Protein- tyrosine kinases (PTKs) play important roles in regulating cell proliferation and differentiation during development. Lee et al. (1993) isolated a 220- bp fragment of PTK7 cDNA through a screen designed to identify tyrosine kinase mRNAs expressed in normal human melanocytes. This fragment was mapped to chromosome 6 by Southern blotting using a panel of human-hamster somatic cell hybrids. Park et al. (1996) isolated a full- length PTK7 cDNA and found that it encodes a receptor protein- tyrosine kinase- like molecule closely related to a chick kinase- like gene whose function was unknown. Mossie et al. (1995) independently isolated the PTK7 gene from colon carcinoma and designated it colon carcinoma kinase- 4. Banga et al. (1997) sublocalized the PTK7 gene to 6p21.1- p12.2 by fluorescence in situ hy-

bridization.

[10670]

[10671] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10672] Lee, S.- T.; Strunk, K. M.; Spritz, R. A. : A survey of protein tyrosine kinase mRNAs expressed in normal human melanocytes. Oncogene 8: 3403- 3410, 1993. ; and

[10673] Park, S.- K.; Lee, H.- S.; Lee, S.- T. : Characterization of the human full- length PTK7 cDNA encoding a receptor protein tyrosine kinase- like molecule closely related to chick KLG. J. Bioch.

[10674] Further studies establishing the function and utilities of PTK7 are found in John Hopkins OMIM database record ID 601890, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protein tyrosine phosphatase, non-receptor type 7 (PTPN7, Accession NP_542156.1) is another GAM69 target gene, herein designated TARGET GENE. PTPN7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTPN7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates

the complementarity of the nucleotide sequences of PTPN7 BINDING SITE, designated SEQ ID:17270, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10675] Another function of GAM69 is therefore inhibition of Protein tyrosine phosphatase, non-receptor type 7 (PTPN7, Accession NP_542156.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN7.

[10676] Protein tyrosine phosphatase, non-receptor type 7 (PTPN7, Accession NP_002823.2) is another GAM69 target gene, herein designated TARGET GENE. PTPN7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTPN7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPN7 BINDING SITE, designated SEQ ID:17270, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10677] Another function of GAM69 is therefore inhibition of Protein tyrosine phosphatase, non-receptor type 7 (PTPN7, Accession NP_002823.2) . Accordingly, utilities of GAM69

include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN7.

[10678] Protein tyrosine phosphatase, non-receptor type 7 (PTPN7, Accession NP_542155.1) is another GAM69 target gene, herein designated TARGET GENE. PTPN7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PTPN7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPN7 BINDING SITE, designated SEQ ID:17270, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10679] Another function of GAM69 is therefore inhibition of Protein tyrosine phosphatase, non-receptor type 7 (PTPN7, Accession NP_542155.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN7.

[10680] Ring finger protein 3 (RNF3, Accession NP_006306.2) is another GAM69 target gene, herein designated TARGET GENE. RNF3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RNF3, corresponding to a target bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF3 BINDING SITE, designated SEQ ID:11664, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10681] Another function of GAM69 is therefore inhibition of Ring finger protein 3 (RNF3, Accession NP_006306.2), a gene which is a mitogen- activated nuclear kinase involved in signal transduction. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF3.

[10682] The function of RNF3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Splicing factor 3a, subunit 3, 60kda (SF3A3, Accession NP_006793.1) is another GAM69 target gene, herein designated TARGET GENE. SF3A3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SF3A3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SF3A3 BINDING SITE,

designated SEQ ID:12715, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10683] Another function of GAM69 is therefore inhibition of Splicing factor 3a, subunit 3, 60kda (SF3A3, Accession NP_006793.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SF3A3.

[10684] Spermatogenesis associated 2 (SPATA2, Accession NP_006029.1) is another GAM69 target gene, herein designated TARGET GENE. SPATA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPATA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPATA2 BINDING SITE, designated SEQ ID:8049, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10685] Another function of GAM69 is therefore inhibition of Spermatogenesis associated 2 (SPATA2, Accession NP_006029.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with SPATA2.

[10686] Suppressor of fused homolog (drosophila) (SUFU, Accession NP_057253.2) is another GAM69 target gene, herein designated TARGET GENE. SUFU BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SUFU, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SUFU BINDING SITE, designated SEQ ID:5078, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10687] Another function of GAM69 is therefore inhibition of Suppressor of fused homolog (drosophila) (SUFU, Accession NP_057253.2) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUFU.

[10688] TUBB-5 (Accession NP_115914.1) is another GAM69 target gene, herein designated TARGET GENE. TUBB-5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TUBB-5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TUBB-5

BINDING SITE, designated SEQ ID:18195, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10689] Another function of GAM69 is therefore inhibition of TUBB-5 (Accession NP_115914.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUBB-5.

[10690] Ubiquitin specific protease 9, y chromosome (fat facets-like drosophila) (USP9Y, Accession NP_004645.1) is another GAM69 target gene, herein designated TARGET GENE. USP9Y BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by USP9Y, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of USP9Y BINDING SITE, designated SEQ ID:4718, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10691] Another function of GAM69 is therefore inhibition of Ubiquitin specific protease 9, y chromosome (fat facets-like drosophila) (USP9Y, Accession NP_004645.1), a gene which removes ubiquitin from ubiquitin- conjugated proteins and has a role in spermatogenesis and therefore may

be associated with Azoospermia. Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of Azoospermia, and of other diseases and clinical conditions associated with USP9Y.

[10692] The function of USP9Y has been established by previous studies. Sun et al. (1999) were the first to trace spermatogenic failure to a point mutation in a Y- linked gene or to a deletion of a single Y- linked gene. They sequenced the AZFa (see OMIM Ref. No. 415000) region of the Y chromosome and identified 2 functional genes previously described: USP9Y and DBY (OMIM Ref. No. 400010). Screening of the 2 genes in 576 infertile and 96 fertile men revealed several sequence variants, most of which appeared to be heritable and of little functional consequence. They found 1 de novo mutation in USP9Y: a 4- bp deletion in the splice donor site, causing an exon to be skipped and protein truncation. This mutation was present in a man with nonobstructive azoospermia, but was absent in his fertile brother, suggesting that the USP9Y mutation caused spermatogenic failure. Sun et al. (1999) also identified a single gene deletion associated with spermatogenic failure, again involving USP9Y, by reanalyzing a published study. The coding regions of the DFFRY and

DFFRX genes show 89% identity at the nucleotide level. In common with DFFRX, the potential amino acid sequence of DFFRY contains the conserved cys and his domains characteristic of ubiquitin C- terminal hydrolases. The human DFFRY mRNA is expressed in a wide range of adult and embryonic tissues, including testis, whereas the homologous mouse Dffry gene is expressed specifically in the testis. Brown et al. (1998) found that 3 azoospermic male patients had deletion of DFFRY from the Y chromosome. Two patients had a testicular phenotype that resembled Sertoli cell- only syndrome (see OMIM Ref. No. 305700), and the third had diminished spermatogenesis. In all 3 patients, the deletions extended from close to the 3- prime end into the gene, removing the entire coding sequence of DFFRY. Brown et al. (1998) showed that the mouse Dffry gene maps to the Sxr- b deletion interval on the shorter arm of the mouse Y chromosome and that its expression in mouse testis can first be detected between 7.5 and 10.5 days after birth when type A and B spermatogonia and preleptotene and leptotene spermatocytes are present.

[10693]

[10694] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[10695] Sun, C.; Skaletsky, H.; Birren, B.; Devon, K.; Tang, Z.; Silber, S.; Oates, R.; Page, D. C. : An azoospermic man with a de novo point mutation in the Y- chromosomal gene USP9Y. Nature Genet. 23: 429- 432, 1999. ; and

[10696] Brown, G. M.; Furlong, R. A.; Sargent, C. A.; Erickson, R. P.; Longepied, G.; Mitchell, M.; Jones, M. H.; Hargreave, T. B.; Cooke, H. J.; Affara, N. A. : Characterisation of the coding.

[10697] Further studies establishing the function and utilities of USP9Y are found in John Hopkins OMIM database record ID 400005, and in cited publications listed in Table 5, which are hereby incorporated by reference.Udp-glucuronate decarboxylase 1 (UXS1, Accession NP_079352.1) is another GAM69 target gene, herein designated TARGET GENE. UXS1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by UXS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UXS1 BINDING SITE, designated SEQ ID:7888, to the nucleotide sequence of GAM69 RNA, herein designated GAM RNA, also designated SEQ ID:258.

[10698] Another function of GAM69 is therefore inhibition of Udp-glucuronate decarboxylase 1 (UXS1, Accession NP_079352.1) . Accordingly, utilities of GAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UXS1.

[10699]

[10700] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 70 (GAM70), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10701] GAM70 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM70 was detected is described hereinabove with reference to Figs. 8-15.

[10702] GAM70 gene, herein designated GAM GENE, and GAM70 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[10703] GAM70 gene encodes a GAM70 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM70 precursor RNA does not encode a protein. A nucleotide sequence

identical or highly similar to the nucleotide sequence of GAM70 precursor RNA is designated SEQ ID:158, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:158 is located at position 38540894 relative to chromosome 17.

[10704] GAM70 precursor RNA folds onto itself, forming GAM70 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10705] GAM70 precursor RNA folds onto itself, forming GAM70 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[10706] Nucleotide sequence of GAM70 precursor RNA, designated SEQ-ID: 158, and a schematic representation of a predicted secondary folding of GAM70 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[10707] An enzyme complex designated DICER COMPLEX, `dices` the GAM70 folded precursor RNA into GAM70 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM70 RNA is designated SEQ ID:358, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[10708] GAM70 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM70 target RNA, herein designated GAM TARGET RNA. GAM70 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[10709] GAM70 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM70 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM70 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM70 RNA may have a different number of target binding sites in untranslated regions of a GAM70 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10710] The complementary binding of GAM70 RNA, herein designated GAM RNA, to target binding sites on GAM70 target RNA, herein designated GAM TARGET RNA, such as BIND-

ING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM70 target RNA into GAM70 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10711] It is appreciated that GAM70 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM70 target genes. The mRNA of each one of this plurality of GAM70 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM70 RNA, herein designated GAM RNA, and which when bound by GAM70 RNA causes inhibition of translation of respective one or more GAM70 target proteins.

[10712] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM70 gene, herein designated GAM GENE, on one or more GAM70 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other

recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10713] It is appreciated that specific functions and accordingly utilities of GAM70 correlate with, and may be deduced from, the identity of the target genes which GAM70 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10714]

[10715]

[10716] C1q and tumor necrosis factor related protein 6 (C1QTNF6, Accession NM_031910.2) is a GAM70 target gene, herein designated TARGET GENE. C1QTNF6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1QTNF6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1QTNF6 BINDING SITE, designated SEQ ID:561, to the nucleotide

sequence of GAM70 RNA, herein designated GAM RNA, also designated SEQ ID:358.

[10717] A function of GAM70 is therefore inhibition of C1q and tumor necrosis factor related protein 6 (C1QTNF6, Accession NM_031910.2) . Accordingly, utilities of GAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF6.

[10718] DKFZP434P211 (Accession NM_014549.1) is another GAM70 target gene, herein designated TARGET GENE. DKFZP434P211 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434P211, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434P211 BINDING SITE, designated SEQ ID:10873, to the nucleotide sequence of GAM70 RNA, herein designated GAM RNA, also designated SEQ ID:358.

[10719] Another function of GAM70 is therefore inhibition of DKFZP434P211 (Accession NM_014549.1) . Accordingly, utilities of GAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P211.

[10720] FLJ13291 (Accession NM_032178.1) is another GAM70 target gene, herein designated TARGET GENE. FLJ13291 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13291, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13291 BINDING SITE, designated SEQ ID:16725, to the nucleotide sequence of GAM70 RNA, herein designated GAM RNA, also designated SEQ ID:358.

[10721] Another function of GAM70 is therefore inhibition of FLJ13291 (Accession NM_032178.1) . Accordingly, utilities of GAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13291.

[10722] FLJ14950 (Accession) is another GAM70 target gene, herein designated TARGET GENE. FLJ14950 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14950, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14950 BINDING SITE, designated SEQ ID:1848, to the nucleotide sequence of GAM70 RNA, herein designated GAM RNA,

also designated SEQ ID:358.

[10723] Another function of GAM70 is therefore inhibition of FLJ14950 (Accession) . Accordingly, utilities of GAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14950.

[10724] LOC254956 (Accession XM_171204.2) is another GAM70 target gene, herein designated TARGET GENE. LOC254956 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254956, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254956 BINDING SITE, designated SEQ ID:10060, to the nucleotide sequence of GAM70 RNA, herein designated GAM RNA, also designated SEQ ID:358.

[10725] Another function of GAM70 is therefore inhibition of LOC254956 (Accession XM_171204.2) . Accordingly, utilities of GAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254956.

[10726] LOC91149 (Accession XM_036480.1) is another GAM70 target gene, herein designated TARGET GENE. LOC91149 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC91149, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91149 BINDING SITE, designated SEQ ID:503, to the nucleotide sequence of GAM70 RNA, herein designated GAM RNA, also designated SEQ ID:358.

[10727] Another function of GAM70 is therefore inhibition of LOC91149 (Accession XM_036480.1) . Accordingly, utilities of GAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91149.

[10728] Serine protease inhibitor, kunitz type 1 (SPINT1, Accession NM_003710.1) is another GAM70 target gene, herein designated TARGET GENE. SPINT1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPINT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPINT1 BINDING SITE, designated SEQ ID:1381, to the nucleotide sequence of GAM70 RNA, herein designated GAM RNA, also designated SEQ ID:358.

[10729] Another function of GAM70 is therefore inhibition of Ser-

ine protease inhibitor, kunitz type 1 (SPINT1, Accession NM_003710.1) . Accordingly, utilities of GAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPINT1.

[10730]

[10731] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 71 (GAM71), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10732] GAM71 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM71 was detected is described hereinabove with reference to Figs. 8-15.

[10733] GAM71 gene, herein designated GAM GENE, and GAM71 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[10734] GAM71 gene encodes a GAM71 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM71 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of

GAM71 precursor RNA is designated SEQ ID:163, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:163 is located at position 56709260 relative to chromosome 12.

[10735] GAM71 precursor RNA folds onto itself, forming GAM71 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10736] GAM71 precursor RNA folds onto itself, forming GAM71 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[10737] Nucleotide sequence of GAM71 precursor RNA, desig-

nated SEQ-ID: 163, and a schematic representation of a predicted secondary folding of GAM71 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[10738] An enzyme complex designated DICER COMPLEX, `dices` the GAM71 folded precursor RNA into GAM71 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM71 RNA is designated SEQ ID:257, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[10739] GAM71 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM71 target RNA, herein designated GAM TARGET RNA. GAM71 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10740] GAM71 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM71 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM71 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM71 RNA may have a different number of target binding sites in untranslated regions of a GAM71 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10741] The complementary binding of GAM71 RNA, herein designated GAM RNA, to target binding sites on GAM71 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits

translation of GAM71 target RNA into GAM71 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10742] It is appreciated that GAM71 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM71 target genes. The mRNA of each one of this plurality of GAM71 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM71 RNA, herein designated GAM RNA, and which when bound by GAM71 RNA causes inhibition of translation of respective one or more GAM71 target proteins.

[10743] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM71 gene, herein designated GAM GENE, on one or more GAM71 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by

those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10744] It is appreciated that specific functions and accordingly utilities of GAM71 correlate with, and may be deduced from, the identity of the target genes which GAM71 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10745]

[10746]

[10747] Atp-binding cassette, sub-family d (ald), member 4 (ABCD4, Accession NM_020323.1) is a GAM71 target gene, herein designated TARGET GENE. ABCD4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ABCD4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABCD4 BINDING SITE, designated SEQ ID:8201, to the nucleotide sequence of GAM71 RNA,

herein designated GAM RNA, also designated SEQ ID:257.

[10748] A function of GAM71 is therefore inhibition of Atp-binding cassette, sub-family d (ald), member 4 (ABCD4, Accession NM_020323.1), a gene which Putative peroxisomal ATP binding cassette transporter. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD4.

[10749] The function of ABCD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM51.1.Ankyrin repeat and btb (poz) domain containing 1 (ABTB1, Accession NM_032548.2) is another GAM71 target gene, herein designated TARGET GENE. ABTB1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ABTB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ABTB1 BINDING SITE, designated SEQ ID:7271, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10750] Another function of GAM71 is therefore inhibition of

Ankyrin repeat and btb (poz) domain containing 1 (ABTB1, Accession NM_032548.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABTB1.

[10751] A disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif, 1 (ADAMTS1, Accession NM_006988.2) is another GAM71 target gene, herein designated TARGET GENE. ADAMTS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAMTS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAMTS1 BINDING SITE, designated SEQ ID:16850, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10752] Another function of GAM71 is therefore inhibition of A disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif, 1 (ADAMTS1, Accession NM_006988.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS1.

[10753] A disintegrin-like and metalloprotease (reprolysin type)

with thrombospondin type 1 motif, 13 (ADAMTS13, Accession NM_139025.1) is another GAM71 target gene, herein designated TARGET GENE. ADAMTS13 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ADAMTS13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAMTS13 BINDING SITE, designated SEQ ID:7432, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10754] Another function of GAM71 is therefore inhibition of A disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif, 13 (ADAMTS13, Accession NM_139025.1), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS13.

[10755] The function of ADAMTS13 has been established by previous studies. Furlan et al. (1996) and Tsai (1996) independently reported that a metal- containing proteolytic en-

zyme (metalloprotease) in normal plasma cleaves the peptide bond between tyrosine at position 842 and methionine at position 843 in monomeric subunits of von Willebrand factor (VWF; 193400), thereby degrading the large multimers. This von Willebrand factor- cleaving protease was found by Furlan et al. (1997) to be deficient in 4 patients with chronic relapsing thrombotic thrombocytopenic purpura (OMIM Ref. No. 274150), 2 of whom were brothers. Because no inhibitor of the enzyme was detected in plasma, the deficiency was ascribed to an abnormality in the production, survival, or function of the protease. Furlan et al. (1998) studied plasma samples from 30 patients with thrombotic thrombocytopenic purpura and 23 patients with the hemolytic- uremic syndrome (HUS; 235400). Of 24 patients with nonfamilial thrombocytopenic purpura, 20 had severe and 4 had moderate protease deficiency during an acute event. An inhibitor of VWF found in 20 of the 24 patients (in all 5 plasma samples tested) was shown to be IgG, i.e., an antibody. Furlan et al. (1998) found that 6 patients with familial thrombocytopenic purpura lacked von Willebrand factor- cleaving protease activity but had no inhibitor, whereas all 10 patients with familial hemolytic- uremic syndrome had nor-

mal protease activity. In vitro proteolytic degradation of von Willebrand factor by the protease was studied in 5 patients with familial and 7 patients with nonfamilial hemolytic- uremic syndrome and was found to function normally in all 12 patients. In 2 Japanese families with Upshaw- Schulman syndrome (OMIM Ref. No. 276850), characterized by congenital TTP with neonatal onset and frequent relapses, Kokame et al. (2002) reported 4 novel mutations, 3 missense and 1 nonsense. Comparison of individual ADAMTS13 genotypes and plasma VWFCP activities indicated that 3 of the mutations, arg268 to pro (R268P; 604134.0014), gln449 to ter (Q449X; 604134.0013), and cys508 to tyr (C508Y; 604134.0015), abrogated activity of the enzyme, whereas the fourth, pro475 to ser (P475S; 604134.0016), retained low but significant activity. The effects of these mutations were further confirmed by expression analysis in HeLa cells. Recombinant VWFCP containing either of the mutations R268P or C508Y was not secreted from cells; in contrast, VWFCP containing either Q449X or P475S was normally secreted but demonstrated minimal activity. Genotype analysis of 364 Japanese subjects revealed that the P475S mutation was heterozygous in 9.6% of individuals, sug-

gesting that approximately 10% of the Japanese population possesses reduced VWFCP activity. Thus, the mutation represents an SNP associated with alterations in VWFCP activity that may be a risk factor for thrombotic disorders.

[10756]

[10757] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10758] Furlan, M.; Robles, R.; Galbusera, M.; Remuzzi, G.; Kyrle, P. A.; Brenner, B.; Krause, M.; Scharrer, I.; Aumann, V.; Mittler, U.; Solenthaler, M.; Lammle, B. : Von Willebrand factor- cleaving protease in thrombotic thrombocytopenic purpura and the hemolytic- uremic syndrome. New Eng. J. Med. 339: 1578- 1584, 1998. ; and

[10759] Kokame, K.; Matsumoto, M.; Soejima, K.; Yagi, H.; Ishizashi, H.; Funato, M.; Tamai, H.; Konno, M.; Kamide, K.; Kawano, Y.; Miyata, T.; Fujimura, Y. : Mutations and common polymorphisms i.

[10760] Further studies establishing the function and utilities of ADAMTS13 are found in John Hopkins OMIM database record ID 604134, and in cited publications listed in Table 5, which are hereby incorporated by reference.AFAP

(Accession NM_021638.2) is another GAM71 target gene, herein designated TARGET GENE. AFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AFAP BINDING SITE, designated SEQ ID:5293, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10761] Another function of GAM71 is therefore inhibition of AFAP (Accession NM_021638.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AFAP.

[10762] Ankyrin repeat and socs box-containing 16 (ASB16, Accession NM_080863.4) is another GAM71 target gene, herein designated TARGET GENE. ASB16 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ASB16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASB16 BINDING SITE, designated SEQ ID:1294, to the nucleotide sequence of

GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10763] Another function of GAM71 is therefore inhibition of Ankyrin repeat and socs box-containing 16 (ASB16, Accession NM_080863.4) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB16.

[10764] Atpase, class i, type 8b, member 2 (ATP8B2, Accession XM_290875.1) is another GAM71 target gene, herein designated TARGET GENE. ATP8B2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP8B2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:18449, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10765] Another function of GAM71 is therefore inhibition of Atpase, class i, type 8b, member 2 (ATP8B2, Accession XM_290875.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2.

[10766] Axl receptor tyrosine kinase (AXL, Accession NM_021913.2) is another GAM71 target gene, herein designated TARGET GENE. AXL BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by AXL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AXL BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10767] Another function of GAM71 is therefore inhibition of Axl receptor tyrosine kinase (AXL, Accession NM_021913.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXL.

[10768] Beta-site app-cleaving enzyme (BACE, Accession NM_138973.1) is another GAM71 target gene, herein designated TARGET GENE. BACE BINDING SITE1 and BACE BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BACE, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Ta-

ble 4 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE1 and BACE BINDING SITE2, designated SEQ ID:12874 and SEQ ID:1238 respectively, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10769] Another function of GAM71 is therefore inhibition of Beta-site app-cleaving enzyme (BACE, Accession NM_138973.1), a gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore may be associated with Alzheimer disease. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of Alzheimer disease, and of other diseases and clinical conditions associated with BACE.

[10770] The function of BACE has been established by previous studies. Cerebral deposition of amyloid beta peptide is an early and critical feature of Alzheimer disease (AD; 104300). Amyloid beta generation depends on proteolytic cleavage of amyloid precursor protein (APP; 104760) by 2 proteases, beta- secretase and gamma- secretase. Vassar et al. (1999) reported the cloning of a human transmembrane aspartic protease that had all the known characteristics of the beta- secretase. Using an expression cloning strategy, they identified a clone that shared significant se-

quence similarity with members of the pepsin subfamily of aspartic proteases. This clone encoded a novel protein, designated BACE for 'beta- site APP- cleaving enzyme.' The BACE open reading frame encodes a protein of 501 amino acids containing a 21- amino acid signal peptide followed by a proprotein domain spanning amino acids 22 to 45. The lumenal domain of the mature protein is followed by 1 predicted transmembrane domain and a short cytosolic C- terminal tail of 24 amino acids. BACE was predicted to be a type 1 transmembrane protein with the active site on the lumenal side of the membrane, where beta- secretase cleaves APP. The BACE protein shares greatest amino acid identity (30%) with cathepsin E (OMIM Ref. No. 116890). Rat and mouse BACE orthologs have 96% amino acid sequence identity with the human BACE protein. Northern blot analysis of human BACE mRNA in adult peripheral tissues and various subregions of the brain detected 3 transcripts of approximately 7.0, 4.4, and 2.6 kb. By in situ hybridization, expression of BACE mRNA in rat brain was observed at higher levels in neurons than in glia, supporting the idea that neurons are the primary source of the extracellular A- beta deposited in amyloid plaques. Vassar et al. (1999) ascribed the differ-

ence between the apparent and calculated molecular weight (approximately 70 and 51 kD, respectively) of the BACE protein to N- linked glycosylation. Immunostaining demonstrated intracellular localization of BACE to the Golgi and endosomes. Transient overexpression of BACE did not affect APP expression, but decreased alpha- secretase cleavage and increased beta- secretase activity in cells expressing wildtype or Swedish mutant (104760.0008) APP. BACE overexpression induced cleavage only at the known beta- secretase positions, asp1 and glu11. Vassar et al. (1999) concluded that their data provided strong evidence that the BACE aspartic protease is the long- sought beta- secretase.

[10771] Animal model experiments lend further support to the function of BACE. Luo et al. (2001) found that mice deficient in BACE1 are healthy, fertile, and appear normal in gross anatomy, tissue histology, hematology, and clinical chemistry. Bace1 - /- mice who are also hemizygous for an amyloid precursor protein transgene lack brain beta-amyloid and beta- secretase- cleaved APP C- terminal fragments. These results provided validation of BACE1 as the major beta- secretase in vivo and suggested that therapeutic inhibition of BACE1 for the treatment of

Alzheimer disease may be free of mechanism- based toxicity.

[10772] It is appreciated that the abovementioned animal model for BACE is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[10773] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10774] Vassar, R.; Bennett, B. D.; Babu- Khan, S.; Kahn, S.; Mendiaz, E. A.; Dents, P.; Taplow, D. B.; Ross, S.; Amaranta, P.; Loeloff, R.; Luo, Y.; Fisher, S.; and 12 others : Beta- secretase cleavage of Alzheimer's amyloid precursor protein by the transmembrane aspartic protease BACE. Science 286: 735- 741, 1999. ; and

[10775] Luo, Y.; Bolon, B.; Kahn, S.; Bennett, B. D.; Babu- Khan, S.; Denis, P.; Fan, W.; Kha, H.; Zhang, J.; Gong, Y.; Martin, L.; Louis, J.- C.; Yan, Q.; Richards, W. G.; Citron, M.; Vassar, R.

[10776] Further studies establishing the function and utilities of BACE are found in John Hopkins OMIM database record ID 604252, and in cited publications listed in Table 5, which are hereby incorporated by reference.B-cell cll/lymphoma

2 (BCL2, Accession NM_000633.1) is another GAM71 target gene, herein designated TARGET GENE. BCL2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BCL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL2 BINDING SITE, designated SEQ ID:8286, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10777] Another function of GAM71 is therefore inhibition of B-cell cll/lymphoma 2 (BCL2, Accession NM_000633.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2.

[10778] Chromosome 14 open reading frame 1 (C14orf1, Accession NM_007176.1) is another GAM71 target gene, herein designated TARGET GENE. C14orf1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf1 BIND-

ING SITE, designated SEQ ID:18564, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10779] Another function of GAM71 is therefore inhibition of Chromosome 14 open reading frame 1 (C14orf1, Accession NM_007176.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf1.

[10780] CGR11 (Accession NM_006569.1) is another GAM71 target gene, herein designated TARGET GENE. CGR11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CGR11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CGR11 BINDING SITE, designated SEQ ID:13993, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10781] Another function of GAM71 is therefore inhibition of CGR11 (Accession NM_006569.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGR11.

[10782] Collagen, type iv, alpha 6 (COL4A6, Accession

NM_001847.1) is another GAM71 target gene, herein designated TARGET GENE. COL4A6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COL4A6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COL4A6 BINDING SITE, designated SEQ ID:11540, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10783] Another function of GAM71 is therefore inhibition of Collagen, type iv, alpha 6 (COL4A6, Accession NM_001847.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A6.

[10784] Cysteine and glycine-rich protein 1 (CSRP1, Accession NM_004078.1) is another GAM71 target gene, herein designated TARGET GENE. CSRP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CSRP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSRP1 BINDING SITE, designated

SEQ ID:14791, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10785] Another function of GAM71 is therefore inhibition of Cysteine and glycine-rich protein 1 (CSRP1, Accession NM_004078.1), a gene which could play a role in neuronal development. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSRP1.

[10786] The function of CSRP1 has been established by previous studies. The human gene encoding cysteine- rich protein (CSRP) is a highly conserved, cell cycle- regulated gene that is induced in the immediate early response to serum repletion in serum- starved, noncycling cells. The LIM/ double zinc finger motif found in cysteine- rich protein is found in an expanding group of proteins with critical functions in gene regulation, cell growth, and somatic differentiation (Wang et al., 1992). Other members of the group include cysteine- rich intestinal protein (CRIP; 123875), CSRP2 (OMIM Ref. No. 601871), CSRP3 (OMIM Ref. No. 600824), and the rhombotin genes RBTN1 (OMIM Ref. No. 186921), RBTN2 (OMIM Ref. No. 180385), and RBTN3 (OMIM Ref. No. 180386). Weiskirchen et al. (1995) described the CRP family of LIM domain proteins Wang et

al. (1992) cloned the human CRP genomic sequence. The CRP gene spans approximately 23.2 kb from the cap site to the polyadenylation site. It contains 6 exons, with a 10.4- kb first intron. The authors showed that CRP is a primary response gene in both human fibroblasts and mouse Balb/c 3T3 cells; in the mouse cells, the kinetic profile of its induction closely paralleled that of c- myc (190080

[10787]

[10788] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10790] Liebhaber, S. A.; Emery, J. G.; Urbanek, M.; Wang, X.; Cooke, N. E. : Characterization of a human cDNA encoding a widely expressed and highly conserved cysteine- rich protein with an unus.

[10791] Further studies establishing the function and utilities of CSRP1 are found in John Hopkins OMIM database record

ID 123876, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NM_004393.1) is another GAM71 target gene, herein designated TARGET GENE. DAG1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DAG1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DAG1 BINDING SITE, designated SEQ ID:11861, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10792] Another function of GAM71 is therefore inhibition of Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NM_004393.1), a gene which may provide linkage between the sarcolemma and extracellular matrix (ECM) and therefore may be associated with Fukuyama-type congenital muscular dystrophy. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of Fukuyama- type congenital muscular dystrophy., and of other diseases and clinical conditions associated with DAG1.

[10793] The function of DAG1 and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Dodecenoyl-coenzyme a delta isomerase (3,2 trans-enoyl-coenzyme a isomerase) (DCI, Accession NM_001919.1) is another GAM71 target gene, herein designated TARGET GENE. DCI BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DCI, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCI BINDING SITE, designated SEQ ID:1497, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10794] Another function of GAM71 is therefore inhibition of Dodecenoyl-coenzyme a delta isomerase (3,2 trans-enoyl-coenzyme a isomerase) (DCI, Accession NM_001919.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCI.

[10795] DKFZP434B103 (Accession NM_015644.1) is another GAM71 target gene, herein designated TARGET GENE. DKFZP434B103 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DK-

FZP434B103, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434B103 BINDING SITE, designated SEQ ID:11454, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10796] Another function of GAM71 is therefore inhibition of DKFZP434B103 (Accession NM_015644.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B103.

[10797] DKFZp434G0920 (Accession) is another GAM71 target gene, herein designated TARGET GENE. DKFZp434G0920 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434G0920, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434G0920 BINDING SITE, designated SEQ ID:15728, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10798] Another function of GAM71 is therefore inhibition of DK-

FZp434G0920 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DK-FZp434G0920.

[10799] DKFZp434L0850 (Accession NM_017558.1) is another GAM71 target gene, herein designated TARGET GENE. DK-FZp434L0850 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DK-FZp434L0850, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434L0850 BINDING SITE, designated SEQ ID:14410, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10800] Another function of GAM71 is therefore inhibition of DK-FZp434L0850 (Accession NM_017558.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434L0850.

[10801] DKFZp547H236 (Accession) is another GAM71 target gene, herein designated TARGET GENE. DKFZp547H236 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by DKFZp547H236, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547H236 BINDING SITE, designated SEQ ID:18786, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10802] Another function of GAM71 is therefore inhibition of DKFZp547H236 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547H236.

[10803] DKFZp547M072 (Accession) is another GAM71 target gene, herein designated TARGET GENE. DKFZp547M072 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp547M072, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547M072 BINDING SITE, designated SEQ ID:15410, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10804] Another function of GAM71 is therefore inhibition of DKFZp547M072 (Accession) . Accordingly, utilities of

GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DK-FZp547M072.

[10805] DKFZP586I2223 (Accession NM_080730.1) is another GAM71 target gene, herein designated TARGET GENE. DK-FZP586I2223 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DKFZP586I2223, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DK-FZP586I2223 BINDING SITE, designated SEQ ID:457, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10806] Another function of GAM71 is therefore inhibition of DK-FZP586I2223 (Accession NM_080730.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586I2223.

[10807] DKFZP586M1120 (Accession NM_031294.1) is another GAM71 target gene, herein designated TARGET GENE. DK-FZP586M1120 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DK-

FZP586M1120, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586M1120 BINDING SITE, designated SEQ ID:7051, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10808] Another function of GAM71 is therefore inhibition of DKFZP586M1120 (Accession NM_031294.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M1120.

[10809] Dual specificity phosphatase 7 (DUSP7, Accession XM_037430.5) is another GAM71 target gene, herein designated TARGET GENE. DUSP7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DUSP7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DUSP7 BINDING SITE, designated SEQ ID:19651, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10810] Another function of GAM71 is therefore inhibition of Dual

specificity phosphatase 7 (DUSP7, Accession XM_037430.5), a gene which is a member of the dual specificity protein phosphatase family . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP7.

[10811] The function of DUSP7 has been established by previous studies. Members of the mitogen- activated protein (MAP) kinase family play a pivotal role in cellular signal transduction. The dual- specificity phosphatases can reverse MAP kinase activation by dephosphorylating critical phosphotyrosine and phosphothreonine residues. Muda et al. (1996) identified rat superior cervical ganglion cDNAs encoding 2 dual- specificity phosphatases that they designated MKP3 (OMIM Ref. No. 602748) and MKPX. The predicted 280- amino acid sequence of the partial MKPX cDNA was 76% identical to that of MKP3. Groom et al. (1996) identified cDNAs encoding the human MKP3 and MKPX homologs, which they called PYST1 and PYST2, respectively. The predicted amino acid sequence of the partial PYST2 cDNA was 73% identical to that of PYST1. Northern analysis revealed that the 3.5- kb PYST2 mRNA was expressed at low levels in several tissues. In liver,

Groom et al. (1996) observed strong expression of a 2.5-kb transcript and much weaker expression of a 5- kb transcript.

[10812]

[10813] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10814] Groom, L. A.; Sneddon, A. A.; Alessi, D. R.; Dowd, S.; Keyse, S. M. : Differential regulation of the MAP, SAP and Rk/p38 kinases by Pyst1, a novel cytosolic dual- specificity phosphatase. EMBO J. 15: 3621- 3632, 1996. ; and

[10815] Muda, M.; Boschert, U.; Dickinson, R.; Martinou, J.- C.; Martinou, I.; Camps, M.; Schlegel, W.; Arkinstall, S. : MKP-3, a novel cytosolic protein- tyrosine phosphatase that exemplifies a.

[10816] Further studies establishing the function and utilities of DUSP7 are found in John Hopkins OMIM database record ID 602749, and in cited publications listed in Table 5, which are hereby incorporated by reference.Egl nine homolog 2 (c. elegans) (EGLN2, Accession NM_080732.1) is another GAM71 target gene, herein designated TARGET GENE. EGLN2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of

mRNA encoded by EGLN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EGLN2 BINDING SITE, designated SEQ ID:16027, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10817] Another function of GAM71 is therefore inhibition of Egl nine homolog 2 (c. elegans) (EGLN2, Accession NM_080732.1), a gene which is an essential component of the pathway. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN2.

[10818] The function of EGLN2 has been established by previous studies. In cultured mammalian cells, Bruick and McKnight (2001) found that the inappropriate accumulation of HIF caused by forced expression of the HIF1- alpha subunit under normoxic conditions was attenuated by coexpression of HPH. Suppression of HPH in cultured Drosophila melanogaster cells by RNA interference resulted in elevated expression of the hypoxia- inducible gene LDH (see OMIM Ref. No. 150000) under normoxic conditions. Bruick and McKnight (2001) concluded that HPH is an essential

component of the pathway through which cells sense oxygen. HIF is a transcriptional complex that plays a central role in mammalian oxygen homeostasis. Posttranslational modification by prolyl hydroxylation is a key regulatory event that targets HIF- alpha (HIF1; 603348) subunits for proteasomal destruction via the von Hippel- Lindau (VHL; 193300) ubiquitylation complex. Epstein et al. (2001) defined a conserved HIF- VHL- prolyl hydroxylase pathway in C. elegans and identified Egl9 as a dioxygenase that regulates HIF by prolyl hydroxylation. In mammalian cells, they showed that the HIF- prolyl hydroxylases are represented by 3 proteins with a conserved 2- histidine- 1- carboxylate iron coordination motif at the catalytic site. The genes encoding these proteins were cloned and termed PHD1, PHD2 (OMIM Ref. No. 606425), and PHD3 (OMIM Ref. No. 606426) by the authors. Direct modulation of recombinant enzyme activity by graded hypoxia, iron chelation, and cobaltous ions mirrored the characteristics of HIF induction in vivo, fulfilling requirements for these enzymes being oxygen sensors that regulate HIF.

[10819]

[10820] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[10821] Bruick, R. K.; McKnight, S. L. : A conserved family of prolyl- 4- hydroxylases that modify HIF. Science 294: 1337-1340, 2001. ; and

[10822] Epstein, A. C. R.; Gleadle, J. M.; McNeill, L. A.; Hewitson, K. S.; O'Rourke, J.; Mole, D. R.; Mukherji, M.; Metzen, E.; Wilson, M. I.; Dhanda, A.; Tian, Y.- M.; Masson, N.; Hamilton, D.

[10823] Further studies establishing the function and utilities of EGLN2 are found in John Hopkins OMIM database record ID 606424, and in cited publications listed in Table 5, which are hereby incorporated by reference.Epithelial membrane protein 1 (EMP1, Accession NM_001423.1) is another GAM71 target gene, herein designated TARGET GENE. EMP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EMP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EMP1 BINDING SITE, designated SEQ ID:13208, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10824] Another function of GAM71 is therefore inhibition of Ep-

ithelial membrane protein 1 (EMP1, Accession NM_001423.1), a gene which plays a role in squamous cell differentiation; member of the PMP22/EMP/MP20 family of membrane glycoproteins. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMP1.

[10825] The function of EMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.Fc fragment of ige, low affinity ii, receptor for (cd23a) (FCER2, Accession NM_002002.2) is another GAM71 target gene, herein designated TARGET GENE. FCER2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FCER2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FCER2 BINDING SITE, designated SEQ ID:9196, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10826] Another function of GAM71 is therefore inhibition of Fc fragment of ige, low affinity ii, receptor for (cd23a) (FCER2, Accession NM_002002.2), a gene which regulates

the synthesis of IgE; contains an inverse RGD motif that binds to IgE. and therefore may be associated with Allergic diseases. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of Allergic diseases., and of other diseases and clinical conditions associated with FCER2.

[10827] The function of FCER2 has been established by previous studies. Ludin et al. (1987) cloned the cDNA coding for a human lymphocyte IgE receptor. Low- affinity receptors and secretor factors, which bind to immunoglobulins of the IgE isotype, play a key role in the regulation of human IgE synthesis. The nucleotide sequence of the cDNA predicted a polypeptide with 321 amino acids and a molecular weight of 36,281 daltons. The role of the IgE receptor in allergic diseases will be of interest. Furthermore, the receptor may be involved in determining the basic level of IgE in serum (OMIM Ref. No. 147050). The human leukocyte differentiation antigen CD23 (FCE2) is a key molecule for B- cell activation and growth. It is the low- affinity receptor for IgE. Furthermore, the truncated molecule can be secreted, then functioning as a potent mitogenic growth factor. Wendel- Hansen et al. (1990) showed by Southern analysis of DNAs from human/rodent cell hy-

brids that the CD23 gene is located on human chromosome 19. As part of a mapping of multiple probes to specific bands on chromosome 19 by fluorescence in situ hybridization, Trask et al. (1993) assigned the FCE2 gene to 19p13.3. Delespesse et al. (1989) studied the influence of IL4 and interferon on the production of CD23.

[10828]

[10829] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10830] Ludin, C.; Hofstetter, H.; Sarfati, M.; Levy, C. A.; Suter, U.; Alaimo, D.; Kilchherr, E.; Frost, H.; Delespesse, G. : Cloning and expression of the cDNA coding for a human lymphocyte IgE receptor. EMBO J. 6: 109- 114, 1987. ; and

[10831] Wendel- Hansen, V.; Riviere, M.; Uno, M.; Jansson, I.; Szpirer, J.; Islam, M. Q.; Levan, G.; Klein, G.; Yodoi, J.; Rosen, A.; Szpirer, C. : The gene encoding CD23 leukocyte antigen (FCE2).

[10832] Further studies establishing the function and utilities of FCER2 are found in John Hopkins OMIM database record ID 151445, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ00001

(Accession XM_088525.2) is another GAM71 target gene, herein designated TARGET GENE. FLJ00001 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ00001, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:6511, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10833] Another function of GAM71 is therefore inhibition of FLJ00001 (Accession XM_088525.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001.

[10834] FLJ10193 (Accession NM_018019.2) is another GAM71 target gene, herein designated TARGET GENE. FLJ10193 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10193, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10193 BINDING SITE, designated SEQ ID:6887, to the nucleotide sequence of GAM71 RNA, herein designated

GAM RNA, also designated SEQ ID:257.

[10835] Another function of GAM71 is therefore inhibition of FLJ10193 (Accession NM_018019.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10193.

[10836] FLJ10604 (Accession) is another GAM71 target gene, herein designated TARGET GENE. FLJ10604 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ10604, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10604 BINDING SITE, designated SEQ ID:753, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10837] Another function of GAM71 is therefore inhibition of FLJ10604 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10604.

[10838] FLJ10743 (Accession NM_018201.2) is another GAM71 target gene, herein designated TARGET GENE. FLJ10743 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10743, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10743 BINDING SITE, designated SEQ ID:10397, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10839] Another function of GAM71 is therefore inhibition of FLJ10743 (Accession NM_018201.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10743.

[10840] FLJ11193 (Accession NM_018356.1) is another GAM71 target gene, herein designated TARGET GENE. FLJ11193 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11193, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11193 BINDING SITE, designated SEQ ID:9608, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10841] Another function of GAM71 is therefore inhibition of FLJ11193 (Accession NM_018356.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ11193.

[10842] FLJ12122 (Accession) is another GAM71 target gene, herein designated TARGET GENE. FLJ12122 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ12122, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12122 BINDING SITE, designated SEQ ID:10593, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10843] Another function of GAM71 is therefore inhibition of FLJ12122 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12122.

[10844] FLJ13153 (Accession) is another GAM71 target gene, herein designated TARGET GENE. FLJ13153 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13153, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13153 BINDING SITE, designated SEQ ID:4589, to the nucleotide

sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10845] Another function of GAM71 is therefore inhibition of FLJ13153 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13153.

[10846] FLJ14100 (Accession NM_025025.1) is another GAM71 target gene, herein designated TARGET GENE. FLJ14100 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14100, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14100 BINDING SITE, designated SEQ ID:12679, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10847] Another function of GAM71 is therefore inhibition of FLJ14100 (Accession NM_025025.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14100.

[10848] FLJ20207 (Accession NM_017711.2) is another GAM71 target gene, herein designated TARGET GENE. FLJ20207 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ20207, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20207 BINDING SITE, designated SEQ ID:4760, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10849] Another function of GAM71 is therefore inhibition of FLJ20207 (Accession NM_017711.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20207.

[10850] FLJ21596 (Accession NM_024823.1) is another GAM71 target gene, herein designated TARGET GENE. FLJ21596 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21596, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21596 BINDING SITE, designated SEQ ID:827, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10851] Another function of GAM71 is therefore inhibition of FLJ21596 (Accession NM_024823.1) . Accordingly, utilities

of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21596.

[10852] FLJ22378 (Accession NM_025078.1) is another GAM71 target gene, herein designated TARGET GENE. FLJ22378 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22378, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22378 BINDING SITE, designated SEQ ID:5148, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10853] Another function of GAM71 is therefore inhibition of FLJ22378 (Accession NM_025078.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22378.

[10854] FLJ32865 (Accession NM_144613.1) is another GAM71 target gene, herein designated TARGET GENE. FLJ32865 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32865, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ32865 BINDING SITE, designated SEQ ID:14411, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10855] Another function of GAM71 is therefore inhibition of FLJ32865 (Accession NM_144613.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32865.

[10856] G protein-coupled receptor kinase-interactor 2 (GIT2, Accession NM_014776.2) is another GAM71 target gene, herein designated TARGET GENE. GIT2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GIT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE, designated SEQ ID:16979, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10857] Another function of GAM71 is therefore inhibition of G protein-coupled receptor kinase-interactor 2 (GIT2, Accession NM_014776.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT2.

[10858] Guanine nucleotide binding protein (g protein), alpha inhibiting activity polypeptide 2 (GNAI2, Accession NM_002070.1) is another GAM71 target gene, herein designated TARGET GENE. GNAI2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GNAI2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GNAI2 BINDING SITE, designated SEQ ID:5504, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10859] Another function of GAM71 is therefore inhibition of Guanine nucleotide binding protein (g protein), alpha inhibiting activity polypeptide 2 (GNAI2, Accession NM_002070.1), a gene which is a human G- alpha inhibitory protein and therefore may be associated with Adrenal cortical tumor. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of Adrenal cortical tumor, and of other diseases and clinical conditions associated with GNAI2.

[10860] The function of GNAI2 has been established by previous studies. Sparkes et al. (1987) and Blatt et al. (1988) used a cDNA probe with a mouse/human somatic cell hybrid

panel to assign the alpha- 2 inhibitory polypeptide to chromosome 3 in man and chromosome 9 in mouse. Blatt et al. (1988) also assigned the GNAI2 gene to chromosome 3 by hybridization of cDNA clones with DNA from human- mouse somatic cell hybrids. Itoh et al. (1988) demonstrated 3 distinct human G- alpha inhibitory proteins. Southern blot analysis indicated that a single copy of each gene is present in the haploid human genome. The alpha- 2 and alpha- 3 genes were found to be composed of 8 coding exons and 7 introns and to possess identical exon- intron organization. Magovcevic et al. (1992) isolated a cDNA for the GNAI2 gene from a human T- cell library and mapped it by chromosomal in situ hybridization to 3p21. A related sequence, GNAI2L (OMIM Ref. No. 139180), was mapped by the same method to 12p13- p12. The assignment to chromosome 3 was supported by PCR amplification of GNAI2- specific sequences in a human/rodent somatic cell hybrid containing only human chromosome 3. Hermouet et al. (1991) demonstrated that activating and inactivating mutations of the GNAI2 gene have opposite effects on proliferation of NIH 3T3 cells. Wilkie et al. (1992) assigned the corresponding gene to mouse chromosome 9. Since somatic mutations in

some growth hormone- secreting pituitary tumors convert the gene for the alpha polypeptide chain of G(s) into a putative oncogene, referred to as GSP (OMIM Ref. No. 139320), Lyons et al. (1990) considered the likelihood that similar mutations would activate other G proteins. They found mutations of the GNAI2 gene that replaced arginine- 179 with either cysteine or histidine in tumors of the adrenal cortex and endocrine tumors of the ovary. They referred to this mutant GNAI2 gene as the GIP2 oncogene. Williamson et al. (1995) studied 32 adrenocorticotrophin hormone- secreting pituitary adenomas for the presence of GSP and GIP mutations. GSP mutations were demonstrated in 2 tumors at codon 227 (139320.0012) and a GIP mutation was identified in 1 tumor at codon 179 (139360.0003).

[10861]

[10862] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10863] Lyons, J.; Landis, C. A.; Harsh, G.; Vallar, L.; Grunewald, K.; Feichtinger, H.; Duh, Q.- Y.; Clark, O. H.; Kawasaki, E.; Bourne, H. R.; McCormick, F. : Two G protein oncogenes in human endocrine tumors. Science 249: 655- 659, 1990. ;

and

[10865] Further studies establishing the function and utilities of GNAI2 are found in John Hopkins OMIM database record ID 139360, and in cited publications listed in Table 5, which are hereby incorporated by reference.GREB1 (Accession NM_014668.2) is another GAM71 target gene, herein designated TARGET GENE. GREB1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GREB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GREB1 BINDING SITE, designated SEQ ID:2037, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10866] Another function of GAM71 is therefore inhibition of GREB1 (Accession NM_014668.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GREB1.

[10867] H-plk (Accession NM_015852.1) is another GAM71 target gene, herein designated TARGET GENE. H-plk BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by H-plk, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of H-plk BINDING SITE, designated SEQ ID:11965, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10868] Another function of GAM71 is therefore inhibition of H-plk (Accession NM_015852.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H-plk.

[10869] HEMK (Accession NM_016173.1) is another GAM71 target gene, herein designated TARGET GENE. HEMK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HEMK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:14603, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also

designated SEQ ID:257.

[10870] Another function of GAM71 is therefore inhibition of HEMK (Accession NM_016173.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK.

[10871] Hir histone cell cycle regulation defective homolog a (s. cerevisiae) (HIRA, Accession NM_003325.3) is another GAM71 target gene, herein designated TARGET GENE. HIRA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HIRA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIRA BINDING SITE, designated SEQ ID:1388, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10872] Another function of GAM71 is therefore inhibition of Hir histone cell cycle regulation defective homolog a (s. cerevisiae) (HIRA, Accession NM_003325.3), a gene which could have a part in mechanisms of transcriptional regulation similar to that played by yeast hir1 and hir2 together. and therefore may be associated with Digeorge syndrome. Accordingly, utilities of GAM71 include diag-

nosis, prevention and treatment of Digeorge syndrome, and of other diseases and clinical conditions associated with HIRA.

[10873] The function of HIRA has been established by previous studies. The human TUPLE1 gene encodes a putative transcription regulator with a sequence similar to that of the yeast TUP1 gene (Halford et al., 1993). The protein product of the TUPLE1 gene contains WD40 domains, motifs thought to be involved in protein- protein interactions. Halford et al. (1993) demonstrated that the TUPLE1 gene maps to chromosome 22 and to the shortest region of deletion overlap in a series of over 100 patients with the DiGeorge syndrome (DGS; 188400), velocardiofacial syndrome (VCFS; 192430), or a related disorder. It is expressed in a range of fetal tissues. Halford et al. (1993) cloned the murine Tuple1 gene and showed that it has strong sequence similarity to the human gene. Since TUPLE1 is a candidate gene for DGS through the mechanism of haploinsufficiency and it might be possible to produce models of this disorder by creating mutations in the mouse gene, Mattei et al. (1994) mapped the gene to mouse chromosome 16 by isotopic in situ hybridization. The experiments were carried out using metaphase

spreads from a WMP male mouse in which all of the autosomes, except 19, were in the form of metacentric Robertsonian translocations. In the human, TUPLE1 is centromeric to COMT (OMIM Ref. No. 116790), which in turn is centromeric to IGLC1 (OMIM Ref. No. 147220); all of these expressed sequences map to mouse chromosome 16. Magnaghi et al. (1998) reported an interaction between HIRA and the transcription factor PAX3 (OMIM Ref. No. 606597). PAX3 haploinsufficiency results in the mouse 'splotch' and human Waardenburg syndrome (see OMIM Ref. No. 193500) phenotypes. Mice homozygous for PAX3 mutations die in utero with a phenocopy of DiGeorge syndrome, or neonatally with neural tube defects. HIRA was also found to interact with core histones. Thus, altered stoichiometry of complexes containing HIRA may be important for the development of structures affected in Waardenburg syndrome and DiGeorge syndrome.

[10874]

[10875] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10876] Halford, S.; Wilson, D. I.; Daw, S. C. M.; Roberts, C.; Wadey, R.; Kamath, S.; Wickremasinghe, A.; Burn, J.;

Goodship, J.; Mattei, M.- G.; Moorman, A. F. M.; Scambler, P. J. : Isolation of a gene expressed during early embryogenesis from the region of 22q11 commonly deleted in DiGeorge syndrome. Hum. Molec. Genet. 2: 1577- 1582, 1993. ; and

[10877] Magnaghi, P.; Roberts, C.; Lorain, S.; Lipinski, M.; Scambler, P. J. : HIRA, a mammalian homologue of Saccharomyces cerevisiae transcriptional co- repressors, interacts with Pax3. Natur.

[10878] Further studies establishing the function and utilities of HIRA are found in John Hopkins OMIM database record ID 600237, and in cited publications listed in Table 5, which are hereby incorporated by reference.Inhibitor of dna binding 4, dominant negative helix-loop-helix protein (ID4, Accession NM_001546.2) is another GAM71 target gene, herein designated TARGET GENE. ID4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ID4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ID4 BINDING SITE, designated SEQ ID:19992, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also

designated SEQ ID:257.

[10879] Another function of GAM71 is therefore inhibition of Inhibitor of dna binding 4, dominant negative helix-loop-helix protein (ID4, Accession NM_001546.2), a gene which negatively regulates cell differentiation. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ID4.

[10880] The function of ID4 has been established by previous studies. Transcription factors containing a basic helix-loop- helix (bHLH) motif regulate the expression of tissue- specific genes in a number of mammalian and insect systems (Pagliuca et al., 1995). DNA- binding activity of the bHLH proteins is dependent on formation of homo- and/or heterodimers. Dominant- negative HLH proteins (encoded by Id- related genes) also contain the HLH- dimerization domain but lack the DNA- binding basic domain. Consequently, Id proteins inhibit binding to DNA and transcriptional transactivation by heterodimerization with bHLH proteins. Pagliuca et al. (1995) reported the cDNA sequence of a novel human HLH gene, to which the symbol ID4 was assigned, which lacks the basic domain. ID4 is differentially expressed in adult organs as 4 mRNA

molecules that are presumably the result of differential splicing and/or alternative polyadenylation sites. Transfection experiments indicated that enforced expression of the ID4 protein inhibits the transactivation of the muscle creatine kinase (CKM; 123310) E- box enhancer by MyoD (MYOD1; 159970). By fluorescence in situ hybridization (FISH), Pagliuca et al. (1995) mapped the ID4 gene to 6p22- p21.3. By the same method, Rigolet et al. (1998) mapped the gene to 6p23- p22.3. For other dominant-negative inhibitors of DNA binding, see ID1 (OMIM Ref. No. 600349), ID2 (OMIM Ref. No. 600386), and ID3 (600277

[10881]

[10882] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10883] Pagliuca, A.; Bartoli, P. C.; Saccone, S.; Valle, G. D.; Lania, L. : Molecular cloning of ID4, a novel dominant negative helix- loop- helix human gene on chromosome 6p21.3-p22. Genomics 27: 200- 203, 1995. ; and

[10884] Rigolet, M.; Rich, T.; Gross- Morand, M.- S.; Molina-Gomes, D.; Viegas- Pequignot, E.; Junien, C. : cDNA cloning, tissue distribution and chromosomal localization

of the human ID4 gene. DNA.

[10885] Further studies establishing the function and utilities of ID4 are found in John Hopkins OMIM database record ID 600581, and in cited publications listed in Table 5, which are hereby incorporated by reference.IL27 (Accession) is another GAM71 target gene, herein designated TARGET GENE. IL27 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IL27, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL27 BINDING SITE, designated SEQ ID:2935, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10886] Another function of GAM71 is therefore inhibition of IL27 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL27.

[10887] Inositol 1,3,4-triphosphate 5/6 kinase (ITPK1, Accession NM_014216.2) is another GAM71 target gene, herein designated TARGET GENE. ITPK1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITPK1, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITPK1 BINDING SITE, designated SEQ ID:18327, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10888] Another function of GAM71 is therefore inhibition of Inositol 1,3,4-triphosphate 5/6 kinase (ITPK1, Accession NM_014216.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPK1.

[10889] KIAA0368 (Accession XM_036708.9) is another GAM71 target gene, herein designated TARGET GENE. KIAA0368 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0368, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0368 BINDING SITE, designated SEQ ID:10473, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10890] Another function of GAM71 is therefore inhibition of KIAA0368 (Accession XM_036708.9) . Accordingly, utilities of GAM71 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0368.

[10891] KIAA0450 (Accession NM_014638.1) is another GAM71 target gene, herein designated TARGET GENE. KIAA0450 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0450, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated SEQ ID:14799, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10892] Another function of GAM71 is therefore inhibition of KIAA0450 (Accession NM_014638.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0450.

[10893] KIAA0469 (Accession NM_014851.1) is another GAM71 target gene, herein designated TARGET GENE. KIAA0469 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0469, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA0469 BINDING SITE, designated SEQ ID:15128, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10894] Another function of GAM71 is therefore inhibition of KIAA0469 (Accession NM_014851.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469.

[10895] KIAA0767 (Accession XM_027105.3) is another GAM71 target gene, herein designated TARGET GENE. KIAA0767 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0767, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0767 BINDING SITE, designated SEQ ID:10304, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10896] Another function of GAM71 is therefore inhibition of KIAA0767 (Accession XM_027105.3) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0767.

[10897] KIAA0775 (Accession) is another GAM71 target gene, herein designated TARGET GENE. KIAA0775 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0775, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0775 BINDING SITE, designated SEQ ID:15906, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10898] Another function of GAM71 is therefore inhibition of KIAA0775 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0775.

[10899] KIAA1010 (Accession XM_050742.5) is another GAM71 target gene, herein designated TARGET GENE. KIAA1010 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1010, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1010 BINDING SITE, designated SEQ ID:17733, to the

nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10900] Another function of GAM71 is therefore inhibition of KIAA1010 (Accession XM_050742.5) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1010.

[10901] KIAA1879 (Accession XM_056635.4) is another GAM71 target gene, herein designated TARGET GENE. KIAA1879 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1879, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1879 BINDING SITE, designated SEQ ID:15615, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10902] Another function of GAM71 is therefore inhibition of KIAA1879 (Accession XM_056635.4) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1879.

[10903] Lipoma hmgic fusion partner (LHFP, Accession

NM_005780.1) is another GAM71 target gene, herein designated TARGET GENE. LHFP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LHFP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LHFP BINDING SITE, designated SEQ ID:5024, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10904] Another function of GAM71 is therefore inhibition of Lipoma hmgic fusion partner (LHFP, Accession NM_005780.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHFP.

[10905] LOC113763 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC113763 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC113763, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC113763 BINDING SITE, designated SEQ ID:14333, to the nucleotide sequence of GAM71 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:257.

[10906] Another function of GAM71 is therefore inhibition of LOC113763 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113763.

[10907] LOC118471 (Accession NM_145202.1) is another GAM71 target gene, herein designated TARGET GENE. LOC118471 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC118471, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC118471 BINDING SITE, designated SEQ ID:10854, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10908] Another function of GAM71 is therefore inhibition of LOC118471 (Accession NM_145202.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118471.

[10909] LOC126364 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC126364 BINDING SITE is a target binding site found in the 5` untranslated

region of mRNA encoded by LOC126364, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126364 BINDING SITE, designated SEQ ID:19761, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10910] Another function of GAM71 is therefore inhibition of LOC126364 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126364.

[10911] LOC144017 (Accession XM_096520.3) is another GAM71 target gene, herein designated TARGET GENE. LOC144017 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144017, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144017 BINDING SITE, designated SEQ ID:9661, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10912] Another function of GAM71 is therefore inhibition of LOC144017 (Accession XM_096520.3) . Accordingly, utili-

ties of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144017.

[10913] LOC145836 (Accession XM_096881.6) is another GAM71 target gene, herein designated TARGET GENE. LOC145836 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC145836, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145836 BINDING SITE, designated SEQ ID:18672, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10914] Another function of GAM71 is therefore inhibition of LOC145836 (Accession XM_096881.6) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145836.

[10915] LOC146237 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC146237 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146237, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146237 BINDING SITE, designated SEQ ID:12330, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10916] Another function of GAM71 is therefore inhibition of LOC146237 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146237.

[10917] LOC149461 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC149461 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149461, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149461 BINDING SITE, designated SEQ ID:10468, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10918] Another function of GAM71 is therefore inhibition of LOC149461 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149461.

[10919] LOC150378 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC150378 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150378, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150378 BINDING SITE, designated SEQ ID:7786, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10920] Another function of GAM71 is therefore inhibition of LOC150378 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150378.

[10921] LOC152286 (Accession XM_098188.1) is another GAM71 target gene, herein designated TARGET GENE. LOC152286 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152286, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152286 BINDING SITE, designated SEQ ID:10326, to the nucleotide sequence of GAM71 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:257.

[10922] Another function of GAM71 is therefore inhibition of LOC152286 (Accession XM_098188.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152286.

[10923] LOC157349 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC157349 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC157349, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157349 BINDING SITE, designated SEQ ID:15688, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10924] Another function of GAM71 is therefore inhibition of LOC157349 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157349.

[10925] LOC159110 (Accession XM_088753.1) is another GAM71 target gene, herein designated TARGET GENE. LOC159110 BINDING SITE is a target binding site found in the 5` un-

translated region of mRNA encoded by LOC159110, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC159110 BINDING SITE, designated SEQ ID:9850, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10926] Another function of GAM71 is therefore inhibition of LOC159110 (Accession XM_088753.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159110.

[10927] LOC161038 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC161038 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC161038, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC161038 BINDING SITE, designated SEQ ID:7787, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10928] Another function of GAM71 is therefore inhibition of

LOC161038 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161038.

[10929] LOC165246 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC165246 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC165246, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC165246 BINDING SITE, designated SEQ ID:16928, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10930] Another function of GAM71 is therefore inhibition of LOC165246 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165246.

[10931] LOC196761 (Accession XM_116865.1) is another GAM71 target gene, herein designated TARGET GENE. LOC196761 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196761, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC196761 BINDING SITE, designated SEQ ID:19133, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10932] Another function of GAM71 is therefore inhibition of LOC196761 (Accession XM_116865.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196761.

[10933] LOC197342 (Accession XM_113869.2) is another GAM71 target gene, herein designated TARGET GENE. LOC197342 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197342, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197342 BINDING SITE, designated SEQ ID:772, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10934] Another function of GAM71 is therefore inhibition of LOC197342 (Accession XM_113869.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC197342.

[10935] LOC203636 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC203636 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC203636, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC203636 BINDING SITE, designated SEQ ID:16235, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10936] Another function of GAM71 is therefore inhibition of LOC203636 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203636.

[10937] LOC219654 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC219654 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC219654, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219654 BINDING SITE, designated SEQ ID:2165, to the

nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10938] Another function of GAM71 is therefore inhibition of LOC219654 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219654.

[10939] LOC221060 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC221060 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221060, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221060 BINDING SITE, designated SEQ ID:18299, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10940] Another function of GAM71 is therefore inhibition of LOC221060 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221060.

[10941] LOC253461 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC253461 BINDING SITE is a target binding site found in the 5` untranslated

region of mRNA encoded by LOC253461, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253461 BINDING SITE, designated SEQ ID:14098, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10942] Another function of GAM71 is therefore inhibition of LOC253461 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253461.

[10943] LOC254182 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC254182 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC254182, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254182 BINDING SITE, designated SEQ ID:18053, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10944] Another function of GAM71 is therefore inhibition of LOC254182 (Accession) . Accordingly, utilities of GAM71

include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254182.

[10945] LOC254427 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC254427 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254427, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254427 BINDING SITE, designated SEQ ID:19884, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10946] Another function of GAM71 is therefore inhibition of LOC254427 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254427.

[10947] LOC255285 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC255285 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255285, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC255285 BINDING SITE, designated SEQ ID:3832, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10948] Another function of GAM71 is therefore inhibition of LOC255285 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255285.

[10949] LOC255481 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC255481 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255481, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255481 BINDING SITE, designated SEQ ID:8843, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10950] Another function of GAM71 is therefore inhibition of LOC255481 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255481.

[10951] LOC255650 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC255650 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255650, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255650 BINDING SITE, designated SEQ ID:9039, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10952] Another function of GAM71 is therefore inhibition of LOC255650 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255650.

[10953] LOC256158 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC256158 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC256158, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:7930, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10954] Another function of GAM71 is therefore inhibition of

LOC256158 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158.

[10955] LOC257494 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC257494 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC257494, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257494 BINDING SITE, designated SEQ ID:3853, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10956] Another function of GAM71 is therefore inhibition of LOC257494 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257494.

[10957] LOC57333 (Accession) is another GAM71 target gene, herein designated TARGET GENE. LOC57333 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC57333, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of LOC57333 BINDING SITE, designated SEQ ID:882, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10958] Another function of GAM71 is therefore inhibition of LOC57333 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57333.

[10959] LOC91759 (Accession XM_040467.1) is another GAM71 target gene, herein designated TARGET GENE. LOC91759 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91759, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91759 BINDING SITE, designated SEQ ID:13656, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10960] Another function of GAM71 is therefore inhibition of LOC91759 (Accession XM_040467.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91759.

[10961] Lysyl oxidase-like 2 (LOXL2, Accession NM_002318.1) is another GAM71 target gene, herein designated TARGET GENE. LOXL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOXL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOXL2 BINDING SITE, designated SEQ ID:9639, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10962] Another function of GAM71 is therefore inhibition of Lysyl oxidase-like 2 (LOXL2, Accession NM_002318.1), a gene which may have roles in senescence and cell adhesion. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOXL2.

[10963] The function of LOXL2 has been established by previous studies. LOXL2 is a member of the lysyl oxidase (LO; 153455) gene family. LO is an extracellular, copper- dependent enzyme that initiates the cross- linking of collagens and elastin by catalyzing the oxidative deamination of peptidyl lysine to alpha- aminoadipic- delta- semialdehyde. Members of the LO family have diverse functions,

including tumor suppression and cell adhesion and senescence Saito et al. (1997) used PCR and 5- prime RACE to obtain a full- length cDNA encoding LOXL2. The predicted 774- amino acid LOXL2 protein contains 3 potential N-linked glycosylation sites and 4 scavenger receptor cysteine- rich (SRCR) domains, which are involved in binding to other cell surface or extracellular molecules. LOXL2 also contains residues conserved among copper- binding proteins. In vitro translation produced an 87- kD LOXL2 protein. Northern blot analysis detected a 3.65- kb LOXL2 transcript in adherent tumor cell lines but not in suspension cell lines. Using cultured fibroblasts, Saito et al. (1997) demonstrated that LOXL2 expression is upregulated in senescent fibroblasts, induced by transforming growth factor beta- 1 (OMIM Ref. No. 190180) and indomethacin, and inhibited by phorbol ester and retinoic acid. They concluded that LOXL2 is an extracellular matrix component that may be specifically involved in cell adhesion and senescence

[10964]

[10965] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10966] Saito, H.; Papaconstantinou, J.; Sato, H.; Goldstein, S. : Regulation of a novel gene encoding a lysyl oxidase- related protein in cellular adhesion and senescence. J. Biol. Chem. 272: 8157- 8160, 1997. ; and

[10967] Saito, H.; Papaconstantinou, J.; Sato, H.; Goldstein, S. : Regulation of a novel gene encoding a lysyl oxidase- related protein in cellular adhesion and senescence. J. Biol. Chem. 272: 8157.

[10968] Further studies establishing the function and utilities of LOXL2 are found in John Hopkins OMIM database record ID 606663, and in cited publications listed in Table 5, which are hereby incorporated by reference.LR8 (Accession NM_014020.2) is another GAM71 target gene, herein designated TARGET GENE. LR8 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LR8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LR8 BINDING SITE, designated SEQ ID:15399, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10969] Another function of GAM71 is therefore inhibition of LR8 (Accession NM_014020.2) . Accordingly, utilities of

GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LR8.

[10970] Lymphocyte antigen 6 complex, locus e (LY6E, Accession NM_002346.1) is another GAM71 target gene, herein designated TARGET GENE. LY6E BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LY6E, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LY6E BINDING SITE, designated SEQ ID:5766, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10971] Another function of GAM71 is therefore inhibition of Lymphocyte antigen 6 complex, locus e (LY6E, Accession NM_002346.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LY6E.

[10972] MARKL1 (Accession) is another GAM71 target gene, herein designated TARGET GENE. MARKL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MARKL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of MARKL1 BINDING SITE, designated SEQ ID:3863, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10973] Another function of GAM71 is therefore inhibition of MARKL1 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARKL1.

[10974] MGC15416 (Accession NM_032371.1) is another GAM71 target gene, herein designated TARGET GENE. MGC15416 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC15416, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC15416 BINDING SITE, designated SEQ ID:18601, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10975] Another function of GAM71 is therefore inhibition of MGC15416 (Accession NM_032371.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15416.

[10976] MGC16025 (Accession NM_032923.1) is another GAM71 target gene, herein designated TARGET GENE. MGC16025 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC16025, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC16025 BINDING SITE, designated SEQ ID:14504, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10977] Another function of GAM71 is therefore inhibition of MGC16025 (Accession NM_032923.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16025.

[10978] Makorin, ring finger protein, 1 (MKRN1, Accession NM_013446.2) is another GAM71 target gene, herein designated TARGET GENE. MKRN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MKRN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MKRN1 BINDING SITE, designated

SEQ ID:17691, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10979] Another function of GAM71 is therefore inhibition of Makorin, ring finger protein, 1 (MKRN1, Accession NM_013446.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKRN1.

[10980] Motilin (MLN, Accession NM_002418.1) is another GAM71 target gene, herein designated TARGET GENE. MLN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MLN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MLN BINDING SITE, designated SEQ ID:13955, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10981] Another function of GAM71 is therefore inhibition of Motilin (MLN, Accession NM_002418.1), a gene which plays an important role in the regulation of interdigestive gastrointestinal motility. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLN.

[10982] The function of MLN has been established by previous studies. Motilin, a 22- amino acid hormone synthesized by cells of the small intestine, regulates interdigestive gastrointestinal contraction. The characterization of cDNA clones encoding human motilin showed that it is derived by proteolytic processing of a 115- amino acid precursor. By a combination of Southern analysis of somatic cell hybrids and in situ hybridization, Fan et al. (1989) assigned the MLN gene to 6p21.2. Daikh et al. (1989) showed that the motilin gene consists of 5 exons spanning approximately 9 kb of genomic DNA. Exon 1 encodes the 5-prime untranslated portion of the motilin mRNA. Exons 2 and 3 encode the signal peptide and the 22- amino acid motilin peptide. Gasparini et al. (1994) showed that MLN is tightly linked to the HLA- DQ- alpha locus (HLA- DQA1; 146880). The chromosomal localization of MNL and its expression in bronchoepithelial cells suggested that this gene may be involved in the immotile cilia syndrome (ICS; 242650) which had previously been assigned to 6p. Sequence and segregation analyses of the MLN gene, carried out in 2 families in which mapping to 6p21.3 had been demonstrated, excluded MLN as a candidate gene for the HLA- associated form of ICS.

[10983]

[10984] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10985] Daikh, D. I.; Douglass, J. O.; Adelman, J. P. : Structure and expression of the human motilin gene. DNA 8: 615- 621, 1989. ; and

[10986] Gasparini, P.; Grifa, A.; Savasta, S.; Merlo, I.; Bisceglia, L.; Totaro, A.; Zelante, L. : The motilin gene: subregional localisation, tissue expression, DNA polymorphisms and exclusion.

[10987] Further studies establishing the function and utilities of MLN are found in John Hopkins OMIM database record ID 158270, and in cited publications listed in Table 5, which are hereby incorporated by reference.Mll septin-like fusion (MSF, Accession NM_006640.2) is another GAM71 target gene, herein designated TARGET GENE. MSF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MSF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MSF BINDING SITE, designated SEQ ID:16611, to the nucleotide se-

quence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10988] Another function of GAM71 is therefore inhibition of Mll septin-like fusion (MSF, Accession NM_006640.2), a gene which plays a role in the cell cycle. and therefore may be associated with Therapy- related acute myeloid leukemia, ovarian tumors. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of Therapy- related acute myeloid leukemia, ovarian tumors, and of other diseases and clinical conditions associated with MSF.

[10989] The function of MSF has been established by previous studies. MLL (OMIM Ref. No. 159555), which is located on 11q23, is frequently rearranged in patients with therapy-related acute myeloid leukemia who previously were treated with DNA topoisomerase II inhibitors. Osaka et al. (1999) identified a fusion partner of MLL in a 10- year-old female who developed therapy- related acute myeloid leukemia 17 months after treatment for Hodgkin disease (OMIM Ref. No. 236000). Leukemia cells of this patient had a t(11;17)(q23;q25), which involved MLL. The partner gene was cloned from cDNA of the leukemia cells by use of a combination of adaptor reverse transcriptase- PCR, rapid amplification of 5- prime cDNA ends (RACE), and

BLAST database analysis to identify ESTs. The full- length cDNA of 2.8 kb was found to be a member of the septin family, and Osaka et al. (1999) therefore designated the gene MSF for 'MLL septin- like fusion gene.' Members of the septin family conserve the GTP- binding domain, localize in the cytoplasm, and interact with cytoskeletal filaments. MSF encodes a putative protein of 568 amino acids, with a predicted molecular mass of about 63 kD. Northern blot analysis revealed a major 4- kb transcript that was expressed ubiquitously, a 1.7- kb transcript that was found in most tissues, and a 3- kb transcript that was found only in hematopoietic tissues. MSF is highly homologous to CDCREL (OMIM Ref. No. 602724), which is a partner gene of MLL in leukemias with a t(11;22)(q23;q11.2). Russell et al. (2000) isolated the same gene, which they designated Ovarian/Breast (Ov/Br) septin, as a candidate for the ovarian tumor suppressor gene that had been indirectly identified by up to 70% loss of heterozygosity (LOH) for a marker at chromosome 17q25 in a bank of malignant ovarian tumors. Two splice variants were demonstrated within the 200- kb contig, which differed only at exon 1. The septins are a family of genes involved in cytokinesis and cell cycle control, whose

known functions are consistent with the hypothesis that the human 17q25 septin gene is a candidate for the ovarian tumor suppressor gene.

[10990]

[10991] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10992] Osaka, M.; Rowley, J. D.; Zeleznik- Le, N. J. : MSF (MLL septin- like fusion), a fusion partner gene of MLL, in a therapy- related acute myeloid leukemia with a t(11;17)(q23;q25). Proc. Nat. Acad. Sci. 96: 6428- 6433, 1999. ; and

[10993] Russell, S. E. H.; McIlhatton, M. A.; Burrows, J. F.; Donaghy, P. G.; Chanduloy, S.; Petty, E. M.; Kalikin, L. M.; Church, S. W.; McIlroy, S.; Harkin, D. P.; Keilty, G. W.; Cranston, A.

[10994] Further studies establishing the function and utilities of MSF are found in John Hopkins OMIM database record ID 604061, and in cited publications listed in Table 5, which are hereby incorporated by reference.N-acetylgalactosaminidase, alpha- (NAGA, Accession NM_000262.1) is another GAM71 target gene, herein designated TARGET GENE. NAGA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by NAGA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NAGA BINDING SITE, designated SEQ ID:8596, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10995] Another function of GAM71 is therefore inhibition of N-acetylgalactosaminidase, alpha- (NAGA, Accession NM_000262.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAGA.

[10996] Procollagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), alpha polypeptide ii (P4HA2, Accession NM_004199.1) is another GAM71 target gene, herein designated TARGET GENE. P4HA2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by P4HA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P4HA2 BINDING SITE, designated SEQ ID:2032, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10997] Another function of GAM71 is therefore inhibition of Pro-collagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), alpha polypeptide ii (P4HA2, Accession NM_004199.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P4HA2.

[10998] Pre-b-cell leukemia transcription factor 2 (PBX2, Accession NM_002586.3) is another GAM71 target gene, herein designated TARGET GENE. PBX2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PBX2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PBX2 BINDING SITE, designated SEQ ID:11494, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[10999] Another function of GAM71 is therefore inhibition of Pre-b-cell leukemia transcription factor 2 (PBX2, Accession NM_002586.3), a gene which binds the sequence 5'- atcaatcaa- 3'. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PBX2.

[11000] The function of PBX2 has been established by previous

studies. Monica et al. (1991) isolated 2 new homeo box genes, PBX2 and PBX3, on the basis of their extensive homology to PBX1 (OMIM Ref. No. 176310), which is involved in t(1;19) translocation in acute pre- B- cell leukemias. The predicted PBX2 and PBX3 proteins were 92 and 94% identical to PBX1 over a large region of 266 amino acids within and flanking their homeodomains, but all 3 proteins diverged significantly near their amino and carboxy termini. Chromosome in situ hybridization demonstrated that the PBX genes map to separate loci: PBX1, 1q23; PBX2, 3q22- q23; PBX3, 9q33- q34. It was subsequently determined that the PBX gene mapped to chromosome 3 was in fact a pseudogene (PBXP1; OMIM Ref. No. 176310). As noted later, PBX2 maps to chromosome 6. Unlike PBX1, which is not expressed in lymphoid cell lines, expression of PBX2 and PBX3 was not restricted to particular states of differentiation or development, as mRNA transcripts of these genes were detected in most fetal and adult tissues and all cell lines. Like PBX1 RNA, PBX3 RNA is alternatively spliced to yield 2 translation products with different carboxy termini, a feature not observed for PBX2. Their extensive sequence similarity and widespread expression suggest a generalized, overlapping

role for PBX proteins in most cell types. Differences in their amino and carboxy termini may modulate their activities, mediated in part by differential splicing and, for PBX1, protein fusion following t(1;19) chromosomal translocation. Aguado and Campbell (1995) characterized the genomic structure of the PBX2 gene on chromosome 6 and showed that it is split into 9 exons. Further, they confirmed that homologous genes map to chromosomes 1 and 3. The chromosome 1 copy may also be a pseudogene.

[11001]

[11002] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11003] Monica, K.; Galili, N.; Nourse, J.; Saltman, D.; Cleary, M. L. : PBX2 and PBX3, new homeobox genes with extensive homology to the human proto- oncogene PBX1. Molec. Cell. Biol. 11: 6149- 6157, 1991. ; and

[11004] Aguado, B.; Campbell, R. D. : The novel gene G17, located in the human major histocompatibility complex, encodes PBX2, a homeodomain- containing protein. Genomics 25: 650- 659, 1995.

[11005] Further studies establishing the function and utilities of

PBX2 are found in John Hopkins OMIM database record ID 176311, and in cited publications listed in Table 5, which are hereby incorporated by reference.Protocadherin 16 dachsous-like (drosophila) (PCDH16, Accession NM_003737.1) is another GAM71 target gene, herein designated TARGET GENE. PCDH16 BINDING SITE1 and PCDH16 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PCDH16, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDH16 BINDING SITE1 and PCDH16 BINDING SITE2, designated SEQ ID:16682 and SEQ ID:6276 respectively, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11006] Another function of GAM71 is therefore inhibition of Protocadherin 16 dachsous-like (drosophila) (PCDH16, Accession NM_003737.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH16.

[11007] Phosphatidylinositol-4-phosphate 5-kinase, type i, gamma (PIP5K1C, Accession XM_047620.3) is another GAM71 target gene, herein designated TARGET GENE.

PIP5K1C BINDING SITE1 and PIP5K1C BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by PIP5K1C, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PIP5K1C BINDING SITE1 and PIP5K1C BINDING SITE2, designated SEQ ID:11489 and SEQ ID:16584 respectively, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11008] Another function of GAM71 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, type i, gamma (PIP5K1C, Accession XM_047620.3) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K1C.

[11009] Protein kinase, lysine deficient 2 (PRKWNK2, Accession) is another GAM71 target gene, herein designated TARGET GENE. PRKWNK2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKWNK2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of PRKWNK2 BINDING SITE, designated SEQ ID:19227, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11010] Another function of GAM71 is therefore inhibition of Protein kinase, lysine deficient 2 (PRKWNK2, Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWNK2.

[11011] PRO2730 (Accession NM_025222.2) is another GAM71 target gene, herein designated TARGET GENE. PRO2730 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO2730, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO2730 BINDING SITE, designated SEQ ID:5236, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11012] Another function of GAM71 is therefore inhibition of PRO2730 (Accession NM_025222.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2730.

[11013] Protein serine kinase h1 (PSKH1, Accession NM_006742.1)

is another GAM71 target gene, herein designated TARGET GENE. PSKH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PSKH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSKH1 BINDING SITE, designated SEQ ID:8943, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11014] Another function of GAM71 is therefore inhibition of Protein serine kinase h1 (PSKH1, Accession NM_006742.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSKH1.

[11015] Protein tyrosine phosphatase, non-receptor type 1 (PTPN1, Accession NM_002827.2) is another GAM71 target gene, herein designated TARGET GENE. PTPN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTPN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PTPN1 BINDING SITE, designated SEQ ID:487, to the nucleotide

sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11016] Another function of GAM71 is therefore inhibition of Protein tyrosine phosphatase, non-receptor type 1 (PTPN1, Accession NM_002827.2), a gene which is a non- receptor type 1 protein tyrosine phosphatase and inhibits insulin signaling. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN1.

[11017] The function of PTPN1 has been established by previous studies. PTP1B inhibits insulin signaling and, when overexpressed, plays a role in insulin resistance (Ahmad et al., 1997). In the 3- prime untranslated region of the PTP1B gene, Di Paola et al. (2002) identified a 1484insG variation (176885.0001) that, in 2 different populations, was associated with several features of insulin resistance. Similar data were obtained in a family- based association study by use of sib pairs discordant for genotype (Gu et al., 2000). Subjects carrying the 1484insG variant showed PTP1B mRNA overexpression in skeletal muscle. PTP1B mRNA stability was significantly higher in human embryonic kidney cells transfected with 1484insG PTP1B as compared with those transfected with wildtype PTP1B. The

data indicated that the 1484insG allele causes PTP1B overexpression and plays a role in insulin resistance. Therefore, individuals carrying the 1484insG variant might particularly benefit from PTP1B inhibitors in the treatment of insulin resistance (Kennedy and Ramachandran, 2000).

[11018] Animal model experiments lend further support to the function of PTPN1. Elchebly et al. (1999) generated PTP1B- deficient mice by targeted disruption of the mouse homolog of the PTP1B gene. Mice were phenotypically and pathologically normal and had normal life span. In the fed state, homozygous mutant mice had slightly lower blood glucose concentrations, and half the circulating insulin concentrations, of wildtype littermates. The enhanced insulin sensitivity of PTP1B- deficient mice was also evident in glucose- and insulin- tolerance tests. After insulin injection, deficient mice showed increased phosphorylation of the insulin receptor in liver and muscle tissue compared to wildtype mice. On a high- fat diet, PTP1B- deficient mice were resistant to weight gain and remained insulin sensitive, while wildtype mice rapidly gained weight and became insulin resistant. These results suggested a major role for PTP1B in modulation of insulin sensitivity and fuel metabolism. The authors proposed PTP1B as a

potential therapeutic target for the treatment of type 2 diabetes and obesity.

[11019] It is appreciated that the abovementioned animal model for PTPN1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[11020] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11021] Elchebly, M.; Payette, P.; Michaliszyn, E.; Cromlish, W.; Collins, S.; Loy, A. L.; Normandin, D.; Cheng, A.; Himms-Hagen, J.; Chan, C.- C.; Ramachandran, C.; Gresser, M. J.; Tremblay, M. L.; Kennedy, B. P. : Increased insulin sensitivity and obesity resistance in mice lacking the protein tyrosine phosphatase- 1B gene. Science 283: 1544- 1548, 1999. ; and

[11022] Di Paola, R.; Frittitta, L.; Miscio, G.; Bozzali, M.; Baratta, R.; Centra, M.; Spampinato, D.; Santagati, M. G.; Ercolino, T.; Cisternino, C.; Soccio, T. Mastroianno, S.; Tassi, V.; Alm.

[11023] Further studies establishing the function and utilities of PTPN1 are found in John Hopkins OMIM database record ID 176885, and in cited publications listed in Table 5, which are hereby incorporated by reference.Retinoic acid

receptor, alpha (RARA, Accession NM_000964.1) is another GAM71 target gene, herein designated TARGET GENE. RARA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RARA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RARA BINDING SITE, designated SEQ ID:3568, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11024] Another function of GAM71 is therefore inhibition of Retinoic acid receptor, alpha (RARA, Accession NM_000964.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RARA.

[11025] Arginyl aminopeptidase (aminopeptidase b) (RNPEP, Accession NM_020216.2) is another GAM71 target gene, herein designated TARGET GENE. RNPEP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNPEP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNPEP BINDING SITE,

designated SEQ ID:8256, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11026] Another function of GAM71 is therefore inhibition of Arginyl aminopeptidase (aminopeptidase b) (RNPEP, Accession NM_020216.2), a gene which is an exopeptidase which selectively removes arginine and/or lysine residues from the n- terminus of several peptide substrates. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPEP.

[11027] The function of RNPEP has been established by previous studies. Aminopeptidase B (EC 3.4.11.6) was originally defined as an exopeptidase capable of trimming basic amino acid residues from the NH2 terminus of peptide substrates (Hopsu et al., 1964). Cadel et al. (1995) demonstrated that it is a Zn(2+)- dependent exopeptidase that selectively removes arginine and/or lysine residues from the N terminus of several peptide substrates. Structurally it is related to leukotriene A4 hydrolase (OMIM Ref. No. 151570), an important enzyme of the arachidonic acid pathway. The structural relationship has its functional counterpart in the capacity of aminopeptidase B to hy-

drolyze leukotriene A4 (Cadel et al., 1997). Antibodies raised against the isolated peptidase show that it is widely distributed in a number of tissues, including endocrine and nonendocrine cell types. It is secreted by rat PC12 pheochromocytoma cells and associated with the external face of their plasma membrane. Together these data strongly argue in favor of participation of this ubiquitous and in vitro bifunctional enzyme in the final stages of precursor processing mechanisms occurring either during the intracellular transport along the secretory pathway or at the plasma membrane level, or both (Aurich- Costa et al., 1997

[11028]

[11029] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11030] Cadel, S.; Foulon, T.; Viron, A.; Balogh, A.; Midol- Monnet, S.; Noel, N.; Cohen, P. : Aminopeptidase B from the rat testis is a bifunctional enzyme structurally related to leukotriene- A4 hydrolase. Proc. Nat. Acad. Sci. 94: 2963-2968, 1997. ; and

[11031] Cadel, S.; Pierotti, A. R.; Foulton, T.; Creminon, C.; Barre, N.; Segretain, D.; Cohen, P. : Aminopeptidase- B in the rat

testes: isolation, functional properties and cellular localizatio.

[11032] Further studies establishing the function and utilities of RNPEP are found in John Hopkins OMIM database record ID 602675, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 15 (oligopeptide transporter), member 1 (SLC15A1, Accession NM_005073.1) is another GAM71 target gene, herein designated TARGET GENE. SLC15A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC15A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC15A1 BINDING SITE, designated SEQ ID:19682, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11033] Another function of GAM71 is therefore inhibition of Solute carrier family 15 (oligopeptide transporter), member 1 (SLC15A1, Accession NM_005073.1), a gene which is a H(+)- coupled peptide transporter. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC15A1.

[11034] The function of SLC15A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Solute carrier family 21 (organic anion transporter), member 9 (SLC21A9, Accession NM_007256.1) is another GAM71 target gene, herein designated TARGET GENE. SLC21A9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC21A9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC21A9 BINDING SITE, designated SEQ ID:5348, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11035] Another function of GAM71 is therefore inhibition of Solute carrier family 21 (organic anion transporter), member 9 (SLC21A9, Accession NM_007256.1), a gene which is Moderately similar to SLC21A2 prostaglandin transporter. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A9.

[11036] The function of SLC21A9 has been established by previous studies. By screening human brain cDNAs for the po-

tential to encode proteins that are at least 50 kD, Nagase et al. (1998) isolated an SLC21A9 cDNA, which they called KIAA0880, that contains a complete coding sequence. The predicted 709- amino acid SLC21A9 protein contains 8 membrane- spanning regions. SLC21A9 shares 42.8% amino acid sequence identity with a rat prostaglandin transporter across 678 residues. RT- PCR followed by ELISA detected SLC21A9 expression in all human tissues examined, with the highest expression in liver, lower expression in lung, ovary, brain, heart, kidney, pancreas, spleen, and testis, and lowest expression in skeletal muscle Organic anion- transporting polypeptides (OATPs) are a family of multispecific carriers that mediate the sodium-independent transport of steroid hormone and conjugates, drugs, and numerous anionic endogenous substrates. St- Pierre et al. (2002) investigated whether members of the OATP gene family could mediate fetal- maternal transfer of anionic steroid conjugates in the human placenta. They isolated OATPB (SLC21A9) from a placenta cDNA library. An antiserum to OATPB detected an 85- kD protein in basal but not apical syncytiotrophoblast membranes. Immunohistochemistry of first-, second-, and third- trimester placenta showed staining in the cytotro-

phoblast membranes and at the basal surface of the syncytiotrophoblast. Trophoblasts that reacted with an antibody to Ki- 67, a proliferation- associated antigen, expressed lower levels of OATPB. OATPB mRNA levels were measured in isolated trophoblasts under culture conditions that promoted syncytia formation. Real- time quantitative PCR estimated an 8- fold increase in OATPB expression on differentiation to syncytia. Pregnenolone sulfate partially inhibited OATPB- mediated transport of estrone- 3- sulfate in an oocyte expression system. The authors concluded that these findings suggested a physiologic role for OATPB in the placental uptake of fetal- derived sulfated steroids

[11037]

[11038] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11039] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Hirosawa, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XII. The complete sequences of 100 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 5: 355- 364, 1998. ; and

[11040] St- Pierre, M. V.; Hagenbuch, B.; Ugele, B.; Meier, P. J.; Stallmach, T. : Characterization of an organic anion-transporting polypeptide (OATP- B) in human placenta. J. Clin. Endocr. Metab.

[11041] Further studies establishing the function and utilities of SLC21A9 are found in John Hopkins OMIM database record ID 604988, and in cited publications listed in Table 5, which are hereby incorporated by reference.Solute carrier family 2 (facilitated glucose transporter), member 10 (SLC2A10, Accession NM_030777.2) is another GAM71 target gene, herein designated TARGET GENE. SLC2A10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC2A10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC2A10 BINDING SITE, designated SEQ ID:1738, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11042] Another function of GAM71 is therefore inhibition of Solute carrier family 2 (facilitated glucose transporter), member 10 (SLC2A10, Accession NM_030777.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with SLC2A10.

[11043] Solute carrier family 5 (sodium-dependent vitamin transporter), member 6 (SLC5A6, Accession NM_021095.1) is another GAM71 target gene, herein designated TARGET GENE. SLC5A6 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC5A6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC5A6 BINDING SITE, designated SEQ ID:19138, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11044] Another function of GAM71 is therefore inhibition of Solute carrier family 5 (sodium-dependent vitamin transporter), member 6 (SLC5A6, Accession NM_021095.1) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC5A6.

[11045] Solute carrier family 6 (neurotransmitter transporter, noradrenalin), member 2 (SLC6A2, Accession NM_001043.1) is another GAM71 target gene, herein designated TARGET GENE. SLC6A2 BINDING SITE is a target binding site found

in the 3` untranslated region of mRNA encoded by SLC6A2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC6A2 BINDING SITE, designated SEQ ID:3434, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11046] Another function of GAM71 is therefore inhibition of Solute carrier family 6 (neurotransmitter transporter, noradrenalin), member 2 (SLC6A2, Accession NM_001043.1), a gene which binds to gt and gc boxes promoters elements. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A2.

[11047] The function of SLC6A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Solute carrier family 9 (sodium/hydrogen exchanger), isoform 3 regulatory factor 2 (SLC9A3R2, Accession NM_004785.1) is another GAM71 target gene, herein designated TARGET GENE. SLC9A3R2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC9A3R2, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC9A3R2 BINDING SITE, designated SEQ ID:16392, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11048] Another function of GAM71 is therefore inhibition of Solute carrier family 9 (sodium/hydrogen exchanger), isoform 3 regulatory factor 2 (SLC9A3R2, Accession NM_004785.1), a gene which interacts with the sodium/hydrogen exchanger (SLC9A3), the cytoskeletal protein ezrin (VIL2) and the testis determining factor (SRY). Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A3R2.

[11049] The function of SLC9A3R2 has been established by previous studies. Mahon et al. (2002) demonstrated that parathyroid hormone receptor- 1 (PTHR1; 168468) binds to the sodium/hydrogen exchanger regulatory factors NHERF1 (OMIM Ref. No. 604990) and NHERF2 through a PDZ- domain interaction in vitro and in PTH target cells. NHERF2 simultaneously binds phospholipase C- beta- 1 and an atypical, carboxyl- terminal PDZ consensus motif,

ETVM, of the PTHR1 through PDZ1 and PDZ2, respectively. PTH treatment of cells that express the NHERF2- PTH1R complex markedly activated phospholipase C- beta and inhibits adenylylcyclase through stimulation of inhibitory G proteins (see OMIM Ref. No. 139310). NHERF- mediated assembly of PTHR1 and phospholipase C- beta is a unique mechanism to regulate PTH signaling in cells and membranes of polarized cells that express NHERF, which may account for many tissue- and cell- specific actions of PTH/PTH- related protein (OMIM Ref. No. 168470) and may also be relevant to signaling by many G protein- coupled receptors Yun et al. (1998) showed that a central domain of NHE3, not a C- terminal domain, interacts with NHERF2 through its second PDZ domain plus its C terminus. Confocal microscopy demonstrated predominantly cytosolic expression of NHERF2 in the absence of NHE3, with more plasma membrane expression in the presence of NHE3. Gel overlay analysis showed that, as seen with NHERF, the N terminus of ezrin (VIL2; 123900) interacts with the C- terminal residues of NHERF2.

[11050]

[11051] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[11052] Mahon, M. J.; Donowitz, M.; Yun, C. C.; Segre, G. V. : Na+/H+ exchanger regulatory factor 2 directs parathyroid hormone 1 receptor signalling. Nature 417: 858- 861, 2002. ; and

[11053] Yun, C.- H. C.; Lamprecht, G.; Forster, D. V.; Sidor, A. : NHE3 kinase A regulatory protein E3KARP binds the epithelial brush border Na(+)/H(+) exchanger NHE3 and the cytoskeletal protein.

[11054] Further studies establishing the function and utilities of SLC9A3R2 are found in John Hopkins OMIM database record ID 606553, and in cited publications listed in Table 5, which are hereby incorporated by reference.SSB-4 (Accession) is another GAM71 target gene, herein designated TARGET GENE. SSB-4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SSB-4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SSB-4 BINDING SITE, designated SEQ ID:7581, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11055] Another function of GAM71 is therefore inhibition of SSB-

4 (Accession) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSB-4.

[11056] Serine/threonine kinase 10 (STK10, Accession NM_005990.1) is another GAM71 target gene, herein designated TARGET GENE. STK10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STK10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STK10 BINDING SITE, designated SEQ ID:13156, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11057] Another function of GAM71 is therefore inhibition of Serine/threonine kinase 10 (STK10, Accession NM_005990.1), a gene which can act on substrates such as myelin basic protein and histone iia on serine and threonine residues. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK10.

[11058] The function of STK10 has been established by previous studies. Kuramochi et al. (1997) cloned the mouse gene Stk10, coding for a new serine/threonine kinase, desig-

nated LOK. Kuramochi et al. (1999) described the cloning of a cDNA encoding the human homolog and the detection of LOK proteins in human lymphoid cells. They deposited the sequence of a human LOK cDNA in GenBank (AB015718). They also determined the chromosomal location of the gene by fluorescence in situ hybridization: 5q35.1 in human, 11A4 in mouse, and 10q12.3 in rat. By means of polymorphic CA repeats found in the 3- prime untranslated region of the mouse Stk10 gene and an intersubspecific backcross mapping panel, they mapped the Stk10 locus to a restricted region on chromosome 11 between D11Mit53 and D11Mit84. These results established STK10 as a new marker of human chromosome 5 to define the syntenic boundary of human chromosomes 5 and 16 on mouse chromosome 11.

[11059]

[11060] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11061] Kuramochi, S.; Matsuda, Y.; Okamoto, M.; Kitamura, F.; Yonekawa, H.; Karasuyama, H. : Molecular cloning of the human gene STK10 encoding lymphocyte- oriented kinase, and comparative chromosomal mapping of the hu-

man, mouse, and rat homologues. Immunogenetics 49: 369- 375, 1999. ; and

[11062] Kuramochi, S.; Moriguchi, T.; Kuida, K.; Endo, J.; Semba, K.; Nishida, E.; Karasuyama, H. : LOK is a novel mouse STE20- like protein kinase that is expressed predominantly in lymphocyte.

[11063] Further studies establishing the function and utilities of STK10 are found in John Hopkins OMIM database record ID 603919, and in cited publications listed in Table 5, which are hereby incorporated by reference.Synaptogyrin 1 (SYNGR1, Accession NM_004711.2) is another GAM71 target gene, herein designated TARGET GENE. SYNGR1 BINDING SITE1 and SYNGR1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by SYNGR1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYNGR1 BINDING SITE1 and SYNGR1 BINDING SITE2, designated SEQ ID:13235 and SEQ ID:11048 respectively, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11064] Another function of GAM71 is therefore inhibition of

Synaptogyrin 1 (SYNGR1, Accession NM_004711.2), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1.

[11065] The function of SYNGR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.Transcription factor ap-4 (activating enhancer binding protein 4) (TFAP4, Accession NM_003223.1) is another GAM71 target gene, herein designated TARGET GENE. TFAP4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TFAP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TFAP4 BINDING SITE, designated SEQ ID:18694, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11066] Another function of GAM71 is therefore inhibition of Transcription factor ap-4 (activating enhancer binding protein 4) (TFAP4, Accession NM_003223.1), a gene which

activates both viral and cellular genes by binding to the symmetrical dna sequence 5'- cagctg- 3'. Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFAP4.

[11067] The function of TFAP4 has been established by previous studies. Transcription factors of the basic helix- loop- helix- zipper (bHLH- Zip) family contain a basic domain, which is used for DNA binding, and HLH and Zip domains, which are used for oligomerization. Transcription factor AP4 activates both viral and cellular genes by binding to the symmetrical DNA sequence CAGCTG (Mermod et al., 1988; Hu et al., 1990). By interspecific backcross analysis, Steingrimsson et al. (1995) mapped the Tfap4 gene to mouse chromosome 16, close to the gene for sperm protamine P1 (PRM1; 182880). Since the PRM1 is located on chromosome 16p13.3 in the human, they suggested that TFAP4 is probably on human chromosome 16. The International Radiation Hybrid Mapping Consortium mapped the TFAP4 gene to chromosome 16p13 (sts- S73885).

[11068]

[11069] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[11070] Hu, Y.- F.; Luscher, B.; Admon, A.; Mermod, N.; Tjian, R. : Transcription factor AP- 4 contains multiple dimerization domains that regulate dimer specificity. Genes Dev. 4: 1741- 1752, 1990. ; and

[11071] Steingrimsson, E.; Sawadogo, M.; Gilbert, D. J.; Zervos, A. S.; Brent, R.; Blanar, M. A.; Fisher, D. E.; Copeland, N. G.; Jenkins, N. A. : Murine chromosomal location of five bHLH- Zip tr.

[11072] Further studies establishing the function and utilities of TFAP4 are found in John Hopkins OMIM database record ID 600743, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tgfb-induced factor 2 (tale family homeobox) (TGIF2, Accession NM_021809.2) is another GAM71 target gene, herein designated TARGET GENE. TGIF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGIF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TGIF2 BINDING SITE, designated SEQ ID:6058, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11073] Another function of GAM71 is therefore inhibition of Tgfb-induced factor 2 (tale family homeobox) (TGIF2, Accession NM_021809.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF2.

[11074] Uncoupling protein 3 (mitochondrial, proton carrier) (UCP3, Accession NM_003356.2) is another GAM71 target gene, herein designated TARGET GENE. UCP3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by UCP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UCP3 BINDING SITE, designated SEQ ID:4639, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11075] Another function of GAM71 is therefore inhibition of Uncoupling protein 3 (mitochondrial, proton carrier) (UCP3, Accession NM_003356.2), a gene which is a mitochondrial transporter protein that creates proton leaks across the inner mitochondrial membrane, thus uncoupling oxidative phosphorylation. and therefore may be associated with Obesity. Accordingly, utilities of GAM71 include diagnosis,

prevention and treatment of Obesity, and of other diseases and clinical conditions associated with UCP3.

[11076] The function of UCP3 has been established by previous studies. With the capacity to participate in thermogenesis and energy balance, UCP3 is an important obesity candidate gene. Bouchard et al. (1997) demonstrated linkage between markers at the UCP2/UCP3 region with resting metabolic rate. This region is syntenic to a region of mouse chromosome 7 that has been linked to hyperinsulinemia and obesity (Fleury et al., 1997).

[11077] Animal model experiments lend further support to the function of UCP3. Clapham et al. (2000) created transgenic mice that overexpress human UCP3 in skeletal muscle. UCP3 expression was driven by the human alpha-skeletal actin (OMIM Ref. No. 102610) promoter, limiting expression to skeletal muscle. Clapham et al. (2000) bred 3 independent lines to homozygosity and selected a line of mice that had a 66- fold increase in UCP3 expression. These mice were hyperphagic but weighed less than their wildtype littermates. Magnetic resonance imaging (MRI) showed a striking reduction in adipose tissue mass. The mice also exhibited lower fasting plasma glucose and insulin levels and an increased glucose clearance rate.

Clapham et al. (2000) concluded that their data provided evidence that skeletal muscle UCP3 has the potential to influence metabolic rates and glucose homeostasis in the whole animal.

[11078] It is appreciated that the abovementioned animal model for UCP3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[11079] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11080] Clapham, J. C.; Arch, J. R. S.; Chapman, H.; Haynes, A.; Lister, C.; Moore, G. B. T.; Piercy, V.; Carter, S. A.; Lehner, I.; Smith, S. A.; Beeley, L. J.; Godden, R. J.; and 15 others : Mice overexpressing human uncoupling protein- 3 in skeletal muscle are hyperphagic and lean. Nature 406: 415- 418, 2000. ; and

[11081] Fleury, C.; Neverova, M.; Collins, S.; Raimbault, S.; Champigny, O.; Levi- Meyrueis, C.; Bouillaud, F.; Seldin, M. F.; Surwit, R. S.; Ricquier, D.; Warden, C. H. : Uncoupling protein- 2.

[11082] Further studies establishing the function and utilities of UCP3 are found in John Hopkins OMIM database record ID

602044, and in cited publications listed in Table 5, which are hereby incorporated by reference.UREB1 (Accession NM_031407.2) is another GAM71 target gene, herein designated TARGET GENE. UREB1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by UREB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UREB1 BINDING SITE, designated SEQ ID:5654, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11083] Another function of GAM71 is therefore inhibition of UREB1 (Accession NM_031407.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UREB1.

[11084] Ubiquitin specific protease 21 (USP21, Accession NM_012475.2) is another GAM71 target gene, herein designated TARGET GENE. USP21 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by USP21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of USP21

BINDING SITE, designated SEQ ID:3093, to the nucleotide sequence of GAM71 RNA, herein designated GAM RNA, also designated SEQ ID:257.

[11085] Another function of GAM71 is therefore inhibition of Ubiquitin specific protease 21 (USP21, Accession NM_012475.2) . Accordingly, utilities of GAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP21.

[11086]

[11087] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 72 (GAM72), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11088] GAM72 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM72 was detected is described hereinabove with reference to Figs. 8-15.

[11089] GAM72 gene, herein designated GAM GENE, and GAM72 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[11090] GAM72 gene encodes a GAM72 precursor RNA, herein

designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM72 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM72 precursor RNA is designated SEQ ID:198, and is provided hereinbelow with reference to the sequence listing part.

[11091] GAM72 precursor RNA folds onto itself, forming GAM72 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11092] GAM72 precursor RNA folds onto itself, forming GAM72 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[11093] Nucleotide sequence of GAM72 precursor RNA, designated SEQ-ID: 198, and a schematic representation of a predicted secondary folding of GAM72 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[11094] An enzyme complex designated DICER COMPLEX, `dices` the GAM72 folded precursor RNA into GAM72 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM72 RNA is designated SEQ ID:342, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[11095] GAM72 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM72 target RNA, herein designated GAM TARGET RNA. GAM72 target RNA comprises three regions, as is typical of mRNA of a

protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[11096] GAM72 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM72 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM72 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM72 RNA may have a different number of target binding sites in untranslated regions of a GAM72 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[11097] The complementary binding of GAM72 RNA, herein desig-

nated GAM RNA, to target binding sites on GAM72 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM72 target RNA into GAM72 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11098] It is appreciated that GAM72 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM72 target genes. The mRNA of each one of this plurality of GAM72 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM72 RNA, herein designated GAM RNA, and which when bound by GAM72 RNA causes inhibition of translation of respective one or more GAM72 target proteins.

[11099] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM72 gene, herein designated GAM GENE, on one or more GAM72 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary bind-

ing site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11100] It is appreciated that specific functions and accordingly utilities of GAM72 correlate with, and may be deduced from, the identity of the target genes which GAM72 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11101]

[11102]

[11103] A kinase (prka) anchor protein 11 (AKAP11, Accession NM_016248.2) is a GAM72 target gene, herein designated TARGET GENE. AKAP11 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AKAP11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of AKAP11 BINDING SITE, designated SEQ ID:10091, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11104] A function of GAM72 is therefore inhibition of A kinase (prka) anchor protein 11 (AKAP11, Accession NM_016248.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP11.

[11105] Arachidonate 15-lipoxygenase, second type (ALOX15B, Accession NM_001141.1) is another GAM72 target gene, herein designated TARGET GENE. ALOX15B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ALOX15B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ALOX15B BINDING SITE, designated SEQ ID:407, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11106] Another function of GAM72 is therefore inhibition of Arachidonate 15-lipoxygenase, second type (ALOX15B, Accession NM_001141.1) . Accordingly, utilities of GAM72

include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALOX15B.

[11107] Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NM_080550.1) is another GAM72 target gene, herein designated TARGET GENE. AP1GBP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AP1GBP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE, designated SEQ ID:8213, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11108] Another function of GAM72 is therefore inhibition of Ap1 gamma subunit binding protein 1 (AP1GBP1, Accession NM_080550.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1.

[11109] Apolipoprotein l, 1 (APOL1, Accession NM_145343.1) is another GAM72 target gene, herein designated TARGET GENE. APOL1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APOL1, corresponding to a target bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APOL1 BINDING SITE, designated SEQ ID:11403, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11110] Another function of GAM72 is therefore inhibition of Apolipoprotein l, 1 (APOL1, Accession NM_145343.1), a gene which may participate in reverse cholesterol transport from peripheral cells to the liver. and therefore may be associated with Schizophrenia. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Schizophrenia, and of other diseases and clinical conditions associated with APOL1.

[11111] The function of APOL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Arylsulfatase d (ARSD, Accession NM_001669.1) is another GAM72 target gene, herein designated TARGET GENE. ARSD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ARSD, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARSD BINDING SITE, designated SEQ ID:14037, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11112] Another function of GAM72 is therefore inhibition of Aryl-sulfatase d (ARSD, Accession NM_001669.1), a gene which hydrolyzes sulfate groups from sugar residues in complex glycoconjugates. and therefore may be associated with X-linked chondrodysplasia punctata. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of X-linked chondrodysplasia punctata., and of other diseases and clinical conditions associated with ARSD.

[11113] The function of ARSD has been established by previous studies. In the course of positional cloning of the gene mutant in X- linked chondrodysplasia punctata (OMIM Ref. No. 302950), Franco et al. (1995) identified a cluster of 3 sulfatase genes located in the region Xp22.3. The genes were arylsulfatases and were designated ARSD, ARSE (OMIM Ref. No. 300180), and ARSF (OMIM Ref. No. 300003), in that order, proceeding from the telomere of Xp toward the centromere. Mutations in ARSE were identified in males with chondrodysplasia punctata. Franco et

al. (1995) showed that both ARSD and ARSE have 11 exons and are transcribed toward the telomere. Their natural substrate was not determined. Meroni et al. (1996) reported that ARSD and ARSE have several typical features of genes that map in the pseudoautosomal region of the X chromosome, i.e., they escape X inactivation, have homologs on the Y chromosome, and are not conserved in mouse. Meroni et al. (1996) noted that ARSD, ARSE, and STS have a conserved gene structure; alignment of the genomic structures revealed perfect conservation of the intron- exon junctions. Sequence analysis of the Y- linked homologs of ARSD and ARSE indicated that they represent truncated pseudogenes.

[11114]

[11115] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11116] Franco, B.; Meroni, G.; Parenti, G.; Levilliers, J.; Bernard, L.; Gebbia, M.; Cox, L.; Maroteaux, P.; Sheffield, L.; Rappold, G. A.; Andria, G.; Petit, C.; Ballabio, A. : A cluster of sulfatase genes on Xp22.3: mutations in chondrodysplasia punctata (CDPX) and implications for warfarin embryopathy. Cell 81: 1- 20, 1995. ; and

[11117] Meroni, G.; Franco, B.; Archidiacono, N.; Messali, S.; Andolfi, G.; Rocchi, M.; Ballabio, A. : Characterization of a cluster of sulfatase genes on Xp22.3 suggests gene duplications in a.

[11118] Further studies establishing the function and utilities of ARSD are found in John Hopkins OMIM database record ID 300002, and in cited publications listed in Table 5, which are hereby incorporated by reference.Biphenyl hydrolase-like (serine hydrolase; breast epithelial mucin-associated antigen) (BPHL, Accession NM_004332.1) is another GAM72 target gene, herein designated TARGET GENE. BPHL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BPHL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BPHL BINDING SITE, designated SEQ ID:16204, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11119] Another function of GAM72 is therefore inhibition of Biphenyl hydrolase-like (serine hydrolase; breast epithelial mucin-associated antigen) (BPHL, Accession NM_004332.1), a gene which involves in detoxification

processes. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BPHL.

[11120] The function of BPHL has been established by previous studies. The serine hydrolases are defined as a functional class of hydrolytic enzymes that contain a serine residue in their active site. They can be grouped into subfamilies that contain closely related members in terms of substrate specificity or amino acid sequence similarity. Puente and Lopez- Otin (1995) isolated a full- length human breast carcinoma cDNA encoding a novel serine hydrolase, BPHL. The deduced 274- amino acid protein shows significant sequence similarity to prokaryotic enzymes involved in the degradation of aromatic compounds; the highest identities, about 25%, are to 4 serine hydrolases encoded by the bphD genes of different strains of Pseudomonas, all of which degrade biphenyl derivatives. Recombinant BPHL protein demonstrated serine hydrolase activity that was abolished by a covalent inhibitor of serine hydrolases. By Northern blot analysis of human tissues, the authors detected a major 1.8- kb BPHL transcript, with highest levels in liver and kidney, and a minor 2.4- kb transcript. They showed that BPHL is expressed as an approximately 30-

kD protein in human liver using Western blot analysis. Puente et al. (1998) determined that the BPHL gene spans approximately 30 kb and contains 8 exons. By fluorescence in situ hybridization, they localized the BPHL gene to 6p25.

[11121]

[11122] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11123] Puente, X. S.; Lopez- Otin, C. : Cloning and expression analysis of a novel human serine hydrolase with sequence similarity to prokaryotic enzymes involved in the degradation of aromatic compounds. J. Biol. Chem. 270: 12926-12932, 1995. ; and

[11124] Puente, X. S.; Pendas, A. M.; Lopez- Otin, C. : Structural characterization and chromosomal localization of the gene encoding human biphenyl hydrolase- related protein (BPHL). Genomics 5.

[11125] Further studies establishing the function and utilities of BPHL are found in John Hopkins OMIM database record ID 603156, and in cited publications listed in Table 5, which are hereby incorporated by reference.Breast cancer 2, early onset (BRCA2, Accession NM_000059.1) is another

GAM72 target gene, herein designated TARGET GENE. BRCA2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BRCA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BRCA2 BINDING SITE, designated SEQ ID:2407, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11126] Another function of GAM72 is therefore inhibition of Breast cancer 2, early onset (BRCA2, Accession NM_000059.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRCA2.

[11127] Chromosome 1 open reading frame 24 (C1orf24, Accession NM_052966.1) is another GAM72 target gene, herein designated TARGET GENE. C1orf24 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by C1orf24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:12135, to the

nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11128] Another function of GAM72 is therefore inhibition of Chromosome 1 open reading frame 24 (C1orf24, Accession NM_052966.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24.

[11129] Chromosome 1 open reading frame 33 (C1orf33, Accession NM_016183.2) is another GAM72 target gene, herein designated TARGET GENE. C1orf33 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1orf33, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1orf33 BINDING SITE, designated SEQ ID:13080, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11130] Another function of GAM72 is therefore inhibition of Chromosome 1 open reading frame 33 (C1orf33, Accession NM_016183.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf33.

[11131] C1q and tumor necrosis factor related protein 2 (C1QTNF2, Accession NM_031908.2) is another GAM72 target gene, herein designated TARGET GENE. C1QTNF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C1QTNF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C1QTNF2 BINDING SITE, designated SEQ ID:9609, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11132] Another function of GAM72 is therefore inhibition of C1q and tumor necrosis factor related protein 2 (C1QTNF2, Accession NM_031908.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF2.

[11133] Chromosome 20 open reading frame 106 (C20orf106, Accession) is another GAM72 target gene, herein designated TARGET GENE. C20orf106 BINDING SITE1 and C20orf106 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by C20orf106, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of C20orf106 BINDING SITE1 and C20orf106 BINDING SITE2, designated SEQ ID:11104 and SEQ ID:16007 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11134] Another function of GAM72 is therefore inhibition of Chromosome 20 open reading frame 106 (C20orf106, Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf106.

[11135] Chromosome 20 open reading frame 142 (C20orf142, Accession XM_300782.1) is another GAM72 target gene, herein designated TARGET GENE. C20orf142 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C20orf142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C20orf142 BINDING SITE, designated SEQ ID:19248, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11136] Another function of GAM72 is therefore inhibition of Chromosome 20 open reading frame 142 (C20orf142, Ac-

cession XM_300782.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf142.

[11137] Chromosome 21 open reading frame 5 (C21orf5, Accession NM_005128.1) is another GAM72 target gene, herein designated TARGET GENE. C21orf5 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C21orf5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf5 BINDING SITE, designated SEQ ID:17560, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11138] Another function of GAM72 is therefore inhibition of Chromosome 21 open reading frame 5 (C21orf5, Accession NM_005128.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf5.

[11139] Chromosome 22 open reading frame 20 (C22orf20, Accession NM_025225.2) is another GAM72 target gene, herein designated TARGET GENE. C22orf20 BINDING SITE is a target binding site found in the 3` untranslated re-

gion of mRNA encoded by C22orf20, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C22orf20 BINDING SITE, designated SEQ ID:15306, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11140] Another function of GAM72 is therefore inhibition of Chromosome 22 open reading frame 20 (C22orf20, Accession NM_025225.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf20.

[11141] C4S-2 (Accession NM_018641.2) is another GAM72 target gene, herein designated TARGET GENE. C4S-2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C4S-2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C4S-2 BINDING SITE, designated SEQ ID:10076, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11142] Another function of GAM72 is therefore inhibition of

C4S-2 (Accession NM_018641.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C4S-2.

[11143] Chromosome 6 open reading frame 10 (C6orf10, Accession NM_006781.1) is another GAM72 target gene, herein designated TARGET GENE. C6orf10 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C6orf10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf10 BINDING SITE, designated SEQ ID:2589, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11144] Another function of GAM72 is therefore inhibition of Chromosome 6 open reading frame 10 (C6orf10, Accession NM_006781.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf10.

[11145] Chromosome 6 open reading frame 29 (C6orf29, Accession NM_032794.1) is another GAM72 target gene, herein designated TARGET GENE. C6orf29 BINDING SITE is a target binding site found in the 3` untranslated region of

multiple transcripts of mRNA encoded by C6orf29, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C6orf29 BINDING SITE, designated SEQ ID:9517, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11146] Another function of GAM72 is therefore inhibition of Chromosome 6 open reading frame 29 (C6orf29, Accession NM_032794.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf29.

[11147] Caspase 10, apoptosis-related cysteine protease (CASP10, Accession NM_032974.1) is another GAM72 target gene, herein designated TARGET GENE. CASP10 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASP10 BINDING SITE, designated SEQ ID:13216, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11148] Another function of GAM72 is therefore inhibition of Caspase 10, apoptosis-related cysteine protease (CASP10, Accession NM_032974.1), a gene which is one aspartate-specific cysteine protease and important in death receptor signaling or other cellular processes. and therefore may be associated with Gastric cancers . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Gastric cancers ., and of other diseases and clinical conditions associated with CASP10.

[11149] The function of CASP10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Caspase 8, apoptosis-related cysteine protease (CASP8, Accession NM_001228.2) is another GAM72 target gene, herein designated TARGET GENE. CASP8 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CASP8 BINDING SITE, designated SEQ ID:10165, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11150] Another function of GAM72 is therefore inhibition of Caspase 8, apoptosis-related cysteine protease (CASP8, Accession NM_001228.2), a gene which is an apoptosis- related caspase and an upstream component of Fas receptor and tumor necrosis factor (TNF) receptor- induced apoptosis. and therefore may be associated with Huntington-related neurodegenerative diseases. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Huntington- related neurodegenerative diseases, and of other diseases and clinical conditions associated with CASP8.

[11151] The function of CASP8 has been established by previous studies. Expression of cDNAs that encode truncated polypeptides containing mostly expanded polyglutamine repeats, but not of those that encode the corresponding full- length proteins, has been shown to induce cell death by apoptosis. Such truncated proteins have been shown to form aggregates or inclusions (Ikeda et al., 1996). Sanchez et al. (1999) studied the role of caspases in polyglutamine- induced cell death in established cultures of primary cortical, striatal, and cerebellar neurons from embryonic day 17 rat embryos, transfected with an expression construct encoding truncated ataxin- 3 that con-

tained 79 glutamine (Q79) residues. The authors showed that the apoptosis inhibitors Bcl2, CrmA, and a truncated Fas/APO1- associated death domain protein (FADD DN) inhibited polyglutamine repeat- induced neuronal cell death. A mutant Jurkat cell line specifically lacking caspase- 8 was resistant to polyglutamine- induced cell death. Cells transfected with Q79 showed insoluble inclusions. Caspase- 8 was recruited and activated by these Q79 inclusions. Western blot analysis revealed the presence of activated caspase- 8 in the insoluble fraction of affected brain regions from Huntington disease (OMIM Ref. No. 143100) patients but not in those from controls. The authors suggested that caspase- 8 has an essential role in Huntington- related neurodegenerative diseases.

[11152] Animal model experiments lend further support to the function of CASP8. Varfolomeev et al. (1998) generated mice deficient in Casp8 by disrupting exons 1 and 2, which encode the N- terminal death effector domains (DEDs) that interact with MORT1/FADD (OMIM Ref. No. 602457). Whereas wildtype and heterozygous mice appeared normal, no homozygous mutant mice survived beyond approximately embryonic day 13.5. Histopathologic analysis revealed marked abdominal hyperemia with ery-

throcytosis in the liver, major blood vessels, capillaries, and other organs. Cardiac ventricular musculature was thin and similar to early mesenchyme. Colony forming assays showed that hemopoietic precursor cells were markedly reduced in the mutant mice. Immunoprecipitation and Western blot analysis indicated that fibroblasts from mutant mice responded normally to the noncytocidal effects of tumor necrosis factor receptor (TNFR; 191190) and death receptor- 3 (DR3, or TNFRSF12; 603366) stimulation, whereas wildtype fibroblasts were killed by TNF (OMIM Ref. No. 191160) treatment or FAS (TNFRSF6; 134637) cross- linking. Agents such as ultraviolet irradiation and protein kinase inhibitors were lethal for mutant and normal fibroblasts. Varfolomeev et al. (1998) concluded that CASP8 is necessary for death induction by receptors of the TNF/nerve growth factor (see OMIM Ref. No. NGFR; 162010) family and is vital in embryonal development.

[11153] It is appreciated that the abovementioned animal model for CASP8 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[11154] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[11155] Sanchez, I.; Xu, C.- J.; Juo, P.; Kakizaka, A.; Blenis, J.; Yuan, J. : Caspase- 8 is required for cell death induced by expanded polyglutamine repeats. Neuron 22: 623- 633, 1999. ; and

[11156] Varfolomeev, E. E.; Schuchmann, M.; Luria, V.; Chiannilkulchai, N.; Beckmann, J. S.; Mett, I. L.; Rebrikov, D.; Brodianski, V. M.; Kemper, O. C.; Kollet, O.; Lapidot, T.; Soffer, D.; So.

[11157] Further studies establishing the function and utilities of CASP8 are found in John Hopkins OMIM database record ID 601763, and in cited publications listed in Table 5, which are hereby incorporated by reference.Centaurin, alpha 2 (CENTA2, Accession NM_018404.1) is another GAM72 target gene, herein designated TARGET GENE. CENTA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CENTA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CENTA2 BINDING SITE, designated SEQ ID:10588, to the nucleotide sequence of GAM72 RNA,

herein designated GAM RNA, also designated SEQ ID:342.

[11158] Another function of GAM72 is therefore inhibition of Centaurin, alpha 2 (CENTA2, Accession NM_018404.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTA2.

[11159] Carbohydrate (chondroitin 6) sulfotransferase 3 (CHST3, Accession NM_004273.2) is another GAM72 target gene, herein designated TARGET GENE. CHST3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CHST3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE, designated SEQ ID:8037, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11160] Another function of GAM72 is therefore inhibition of Carbohydrate (chondroitin 6) sulfotransferase 3 (CHST3, Accession NM_004273.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3.

[11161] Cyclic nucleotide gated channel beta 1 (CNGB1, Accession

NM_001297.1) is another GAM72 target gene, herein designated TARGET GENE. CNGB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CNGB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNGB1 BINDING SITE, designated SEQ ID:8665, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11162] Another function of GAM72 is therefore inhibition of Cyclic nucleotide gated channel beta 1 (CNGB1, Accession NM_001297.1), a gene which has probable role in photoreception. and therefore may be associated with Retinitis pigmentosa. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Retinitis pigmentosa, and of other diseases and clinical conditions associated with CNGB1.

[11163] The function of CNGB1 has been established by previous studies. See CNCG1 (OMIM Ref. No. 123825). The human and bovine rod photoreceptor cGMP- gated cation channel consists of 2 subunits: alpha (63 kD; 123825) and beta (OMIM Ref. No. 240 kD). Ardell et al. (1996) provided evidence that the human GAR1 protein is encoded by the N-

terminal region of the gene encoding the beta subunit of the cGMP- gated photoreceptor channel Bareil et al. (2001) studied a consanguineous French family with autosomal recessive retinitis pigmentosa (RP; 268000). Autosomal recessive RP accounts for 5 to 20% of all RP, whereas sporadic RP, presumed to be recessive in most cases, accounts for a further 40 to 50% (Bird, 1995). Bareil et al. (2001) excluded linkage to known loci involved in RP and by homozygosity mapping localized the disease gene in this family to 16q13- q21. They noted 2 candidate genes, KIFC3 (OMIM Ref. No. 604535) and CNGB1. Mutation analysis demonstrated that CNGB1 was mutated in this family

[11164]

[11165] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11166] Ardell, M. D.; Aragon, I.; Oliveira, L.; Porche, G. E.; Burke, E.; Pittler, S. J. : The beta subunit of human rod photoreceptor cGMP- gated cation channel is generated from a complex transcription unit. FEBS Lett. 389: 213- 218, 1996. ; and

[11167] Bareil, C.; Hamel, C. P.; Delague, V.; Arnaud, B.; Demaille,

J.; Claustres, M. : Segregation of a mutation in CNGB1 encoding the beta- subunit of the rod cGMP- gated channel in a family wi.

[11168] Further studies establishing the function and utilities of CNGB1 are found in John Hopkins OMIM database record ID 600724, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cyclin m1 (CNNM1, Accession NM_020348.1) is another GAM72 target gene, herein designated TARGET GENE. CNNM1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CNNM1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:14071, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11169] Another function of GAM72 is therefore inhibition of Cyclin m1 (CNNM1, Accession NM_020348.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1.

[11170] Carboxypeptidase m (CPM, Accession NM_001874.1) is

another GAM72 target gene, herein designated TARGET GENE. CPM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CPM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPM BINDING SITE, designated SEQ ID:2111, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11171] Another function of GAM72 is therefore inhibition of Carboxypeptidase m (CPM, Accession NM_001874.1), a gene which specifically removes COOH- terminal basic amino acids (arginine or lysine). Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPM.

[11172] The function of CPM has been established by previous studies. Carboxypeptidases specifically remove COOH-terminal basic amino acids (arginine or lysine). They have important functions in many biologic processes, including activation, inactivation, or modulation of peptide hormone activity and alteration of physical properties of proteins and enzymes. Carboxypeptidase M is a membrane- bound arginine/lysine carboxypeptidase found in many tissues

and cultured cells. Rehli et al. (1995) found that its expression associated with monocyte to macrophage differentiation. Tan et al. (1989) described the molecular cloning and sequencing of the cDNA for human carboxypeptidase M from a human placental cDNA library. The 2- kb cDNA contained an open reading frame of 1,317 basepairs, encoding a 439- amino acid protein. Sequence analysis revealed hydrophobic regions at the NH(2) and carboxy termini. There are 6 potential asparagine- linked glycosylation sites. Observed sequence homologies with other carboxypeptidases were as follows: human plasma carboxypeptidase N (OMIM Ref. No. 212070), 41%; bovine carboxypeptidase H (OMIM Ref. No. 114855), 41%; and bovine pancreatic carboxypeptidases A and B, 15%. The active site residues of carboxypeptidases A and B are conserved in carboxypeptidase M

[11173]

[11174] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11175] Rehli, M.; Krause, S. W.; Kreutz, M.; Andreesen, R. : Carboxypeptidase M is identical to the MAX.1 antigen and its expression is associated with monocyte to macrophage

differentiation. J. Biol. Chem. 270: 15644- 15649, 1995. ; and

[11176] Tan, F.; Chan, S. J.; Steiner, D. F.; Schilling, J. W.; Skidgel, R. A. : Molecular cloning and sequencing of the cDNA for human membrane- bound carboxypeptidase M: comparison with carboxy.

[11177] Further studies establishing the function and utilities of CPM are found in John Hopkins OMIM database record ID 114860, and in cited publications listed in Table 5, which are hereby incorporated by reference.CPR2 (Accession NM_030900.1) is another GAM72 target gene, herein designated TARGET GENE. CPR2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CPR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CPR2 BINDING SITE, designated SEQ ID:14297, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11178] Another function of GAM72 is therefore inhibition of CPR2 (Accession NM_030900.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with CPR2.

[11179] Carnitine o-octanoyltransferase (CROT, Accession NM_021151.1) is another GAM72 target gene, herein designated TARGET GENE. CROT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CROT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CROT BINDING SITE, designated SEQ ID:14662, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11180] Another function of GAM72 is therefore inhibition of Carnitine o-octanoyltransferase (CROT, Accession NM_021151.1), a gene which CROT plays a crucial role in the beta- oxidation of branched- chain fatty acids including pristanic acid. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CROT.

[11181] The function of CROT has been established by previous studies. Carnitine octanoyltransferase (EC 2.3.1.137) is a carnitine acyltransferase that catalyzes the reversible transfer of fatty acyl groups between CoA and carnitine. This provides a crucial step in the transport of medium-

and long- chain acyl- CoA out of the mammalian peroxisome to the cytosol and mitochondria. See also CRAT (OMIM Ref. No. 600184). Van der Leij et al. (2000) reviewed the function, structural features, and phylogenetics of human carnitine acyltransferase genes, including CROT Using enzyme activity measurements of CROT expressed in a carnitine acetyltransferase- deficient yeast strain, Ferdinandusse et al. (1999) demonstrated that CROT efficiently converts a branched- chain fatty acyl- CoA (4,8- dimethylnonanoyl- CoA) to its corresponding carnitine ester. They hypothesized that CROT plays a crucial role in the beta- oxidation of branched- chain fatty acids including pristanic acid

[11182]

[11183] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11184] Ferdinandusse, S.; Mulders, J.; IJlst, L.; Denis, S.; Dacremont, G.; Waterham, H. R.; Wanders, R. J. A. : Molecular cloning and expression of human carnitine octanoyltransferase: evidence for its role in the peroxisomal beta- oxidation of branched- chain fatty acids. Biochem. Biophys. Res. Commun. 263: 213- 218, 1999. ; and

[11186] Further studies establishing the function and utilities of CROT are found in John Hopkins OMIM database record ID 606090, and in cited publications listed in Table 5, which are hereby incorporated by reference.CSL4 (Accession NM_016046.2) is another GAM72 target gene, herein designated TARGET GENE. CSL4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CSL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CSL4 BINDING SITE, designated SEQ ID:16124, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11187] Another function of GAM72 is therefore inhibition of CSL4 (Accession NM_016046.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSL4.

[11188] Cathepsin s (CTSS, Accession NM_004079.3) is another GAM72 target gene, herein designated TARGET GENE.

CTSS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTSS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CTSS BINDING SITE, designated SEQ ID:2354, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11189] Another function of GAM72 is therefore inhibition of Cathepsin s (CTSS, Accession NM_004079.3), a gene which is a lysosomal cysteine (thiol) protease that cleaves elastin. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTSS.

[11190] The function of CTSS has been established by previous studies. Alveolar macrophages express an elastase activity of acidic pH optimum inhibitable by cysteine protease inhibitors. It had been shown that the only previously known eukaryotic elastinolytic cysteine protease, cathepsin L (OMIM Ref. No. 116880), could not completely account for this activity. In a search for additional cysteine proteases with elastinolytic activity, Shi et al. (1992) used low- degeneracy oligonucleotide primers based on re-

gions of strong amino acid homology among the known cysteine proteases to screen reverse- transcribed human alveolar macrophage RNA for cysteine proteases by PCR. The screening turned up a cDNA sequence highly homologous to bovine cathepsin S. The recombinant enzyme was found to be elastinolytic. The relatively broad pH range of human cathepsin S activity suggested that it plays a significant role in the contact- dependent elastase activity of alveolar macrophages Northern blot analysis by Shi et al. (1994) showed that cathepsin S shows a restricted tissue distribution, with highest levels in spleen, heart, and lung. Immunostaining of lung tissue demonstrated detectable cathepsin S only in lung macrophages. The high level of expression in the spleen and in phagocytes suggested to Shi et al. (1994) that cathepsin S may have a specific function in immunity, perhaps related to antigen processing.

[11191] Animal model experiments lend further support to the function of CTSS. Cathepsins S and L play prominent roles in the degradation of the invariant chain (Ii, or CD74; 142790). In I- A(b) class II mice lacking the Ctss gene, failure to degrade Ii resulted in the accumulation of a class II- associated, 10- kD Ii fragment within endosomes, disrupting class II trafficking, peptide complex formation,

and class II- restricted antigen presentation (Driessen et al., 1999). Riese et al. (2001) showed that I- A(b) class II haplotype mice lacking the Ctss gene had impaired NK1.1- positive T- cell selection and function. There were no overt defects in Cd4 (OMIM Ref. No. 186940)- positive and Cd8 (see OMIM Ref. No. 186910)- positive T- cell populations. In Ctss - /- mice, thymic dendritic cells had defective presentation of the Cd1d (OMIM Ref. No. 188410)- restricted antigen, the marine sponge glycosphingolipid alpha- galactosylceramide. Cd1d colocalized with Ii fragments and accumulated within endocytic dendritic cell compartments, impairing Cd1d trafficking. This dysfunction did not occur, however, in Ctss - /- mice of the I- A(k) class II haplotype. Riese et al. (2001) concluded that Cd1d function is critically linked to the processing of Ii, revealing that MHC class II haplotype and Ctss activity are regulators of NK T cells.

[11192] It is appreciated that the abovementioned animal model for CTSS is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[11193] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[11194] Shi, G.- P.; Webb, A. C.; Foster, K. E.; Knoll, J. H. M.; Lemere, C. A.; Munger, J. S.; Chapman, H. A. : Human cathepsin S: chromosomal localization, gene structure, and tissue distribution. J. Biol. Chem. 269: 11530- 11536, 1994. ; and

[11195] Riese, R. J.; Shi, G.- P.; Villadangos, J.; Stetson, D.; Driessen, C.; Lennon- Dumenil, A.- M.; Chu, C.- L.; Naumov, Y.; Behar, S. M.; Ploegh, H.; Locksley, R.; Chapman, H. A. : Regulation o.

[11196] Further studies establishing the function and utilities of CTSS are found in John Hopkins OMIM database record ID 116845, and in cited publications listed in Table 5, which are hereby incorporated by reference.Chromosome y open reading frame 14 (CYorf14, Accession NM_018542.1) is another GAM72 target gene, herein designated TARGET GENE. CYorf14 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CY-orf14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYorf14 BINDING SITE, designated SEQ ID:4714, to the nucleotide sequence of GAM72 RNA,

herein designated GAM RNA, also designated SEQ ID:342.

[11197] Another function of GAM72 is therefore inhibition of Chromosome y open reading frame 14 (CYorf14, Accession NM_018542.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYorf14.

[11198] Cytochrome p450, subfamily iiia (niphedipine oxidase), polypeptide 4 (CYP3A4, Accession NM_017460.3) is another GAM72 target gene, herein designated TARGET GENE. CYP3A4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CYP3A4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYP3A4 BINDING SITE, designated SEQ ID:15095, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11199] Another function of GAM72 is therefore inhibition of Cytochrome p450, subfamily iiia (niphedipine oxidase), polypeptide 4 (CYP3A4, Accession NM_017460.3), a gene which may be involved in an nadph- dependent electron transport pathway. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with CYP3A4.

[11200] The function of CYP3A4 has been established by previous studies. Watkins et al. (1985) identified a glucocorticoid-inducible cytochrome P450 in human liver. Molowa et al. (1986) reported the complete cDNA sequence of this P450. Wrighton and Vandenbranden (1989) isolated a CYP3- type cytochrome P450 from human fetal liver. By somatic cell hybridization and in situ hybridization, Riddell et al. (1987) assigned to chromosome 7 the gene for a cytochrome P450 that encodes the enzyme nifedipine oxidase (CYP3). The assignment to chromosome 7 was corroborated by Gonzalez et al. (1988) by use of somatic cell hybrids. These authors also provided additional evidence supporting the identity of P450PCN1 and nifedipine oxidase. By multipoint linkage analysis using DNA markers known to be located on chromosome 7, Brooks et al. (1988) concluded that the most likely location of CYP3 is 7q21- q22.1. No recombination with a COL1A2 (OMIM Ref. No. 120160) marker was found. Spurr et al. (1989) assigned CYP3 to 7q22- qter by study of a panel of human- rodent somatic cell hybrids. Inoue et al. (1992) mapped CYP3A4 to 7q22.1 by fluorescence in situ hybridization. The induction of CYP3A enzymes is species-

specific and believed to involve 1 or more cellular factors, or receptor- like xenosensors. Xie et al. (2000) identified PXR/SXR as one such factor. They showed that targeted disruption of the mouse Pxr gene abolished induction of CYP3A by prototypic inducers such as dexamethasone or pregnenolone- 16- alpha- carbonitrile. In Pxr- null mice carrying a transgene for an activated form of human SXR, there was constitutive upregulation of CYP3A gene expression and enhanced protection against toxic xenobiotic compounds. Xie et al. (2000) demonstrated that species origin of the receptor, rather than the promoter structure of the CYP3A genes, dictates the species- specific pattern of CYP3A inducibility. Thus, they could generate 'humanized' transgenic mice that were responsive to human- specific inducers such as the antibiotic rifampicin. Xie et al. (2000) concluded that the SXR/PXR genes encode the primary species- specific xenosensors that mediate the adaptive hepatic response, and may represent the critical biochemical mechanism of human xenoprotection.

[11201]

[11202] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[11203] Inoue, K.; Inazawa, J.; Nakagawa, H.; Shimada, T.; Yamazaki, H.; Guengerich, F. P.; Abe, T. : Assignment of the human cytochrome P- 450 nifedipine oxidase gene (CYP3A4) to chromosome 7 at band q22.1 by fluorescence in situ hybridization. Jpn. J. Hum. Genet. 37: 133- 138, 1992. ; and

[11204] Xie, W.; Barwick, J. L.; Downes, M.; Blumberg, B.; Simon, C. M.; Nelson, M. C.; Neuschwander- Tetri, B. A.; Brunt, E. M.; Guzelian, P. S.; Evans, R. M. : Humanized xenobiotic response.

[11205] Further studies establishing the function and utilities of CYP3A4 are found in John Hopkins OMIM database record ID 124010, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dual adaptor of phosphotyrosine and 3-phosphoinositides (DAPP1, Accession NM_014395.1) is another GAM72 target gene, herein designated TARGET GENE. DAPP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DAPP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DAPP1 BINDING SITE,

designated SEQ ID:8299, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11206] Another function of GAM72 is therefore inhibition of Dual adaptor of phosphotyrosine and 3-phosphoinositides (DAPP1, Accession NM_014395.1), a gene which regulates the ras- cyclic amp pathway. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPP1.

[11207] The function of DAPP1 has been established by previous studies. By EST database searching for pleckstrin homology (PH) domain- containing proteins, followed by screening a universal cDNA library, Dowler et al. (1999) isolated a cDNA encoding DAPP1. Sequence analysis predicted that the 280- amino acid protein contains a potential myristoylation site (a glycine after the N- terminal methionine), an N- terminal SH2 domain, and a C- terminal PH domain with a PtdIns- interacting motif. The authors noted that APS (OMIM Ref. No. 605300) also has an SH2 domain and a PH domain but at opposite termini of the protein. PCR of cDNA libraries and Northern blot analysis revealed ubiquitous expression of 2.7- kb transcripts, with highest levels in placenta and lung. A protein- lipid

overlay analysis indicated that the PH domain of DAPP1 interacts with physiologic enantiomers of PtdIns. Using suppression subtractive hybridization with follicular dendritic cell tester cDNA, Marshall et al. (2000) cloned BAM32 and a splice variant identical to DAPP1. In addition to the SH2 and PH domains noted by Dowler et al. (1999), Marshall et al. (2000) predicted the presence of a potential tyrosine phosphorylation site in BAM32. Northern blot analysis detected an abundant 2.9- kb transcript and a minor 4.4- kb transcript in all hemopoietic tissues, as well as in trachea and placenta. RT- PCR analysis revealed expression in all B- cell lines, but not in T- cell, epithelial cell, fibroblast, or myelocytic leukemia cell lines. Activation of B cells was found to increase BAM32 expression. Immunoblot analysis showed that stimulation also induces BAM32 association with PLCG2 (OMIM Ref. No. 600220) and tyrosine phosphorylation of a 36- kD protein. Confocal microscopy demonstrated a PI3K- dependent membrane localization of BAM32 after B- cell receptor (BCR) activation. Luciferase reporter analysis showed that expression of the PH domain of BAM32 inhibits BCR- induced activation of NFATC (see OMIM Ref. No. 600489).

[11208]

[11209] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11210] Dowler, S.; Currie, R. A.; Downes, C. P.; Alessi, D. R. : DAPP1: a dual adaptor for phosphotyrosine and 3- phosphoinositides. Biochem. J. 342: 7- 12, 1999. ; and

[11211] Marshall, A. J.; Niiro, H.; Lerner, C. G.; Yun, T. J.; Thomas, S.; Disteche, C. M.; Clark, E. A. : A novel B lymphocyte-associated adaptor protein, Bam32, regulates antigen receptor si.

[11212] Further studies establishing the function and utilities of DAPP1 are found in John Hopkins OMIM database record ID 605768, and in cited publications listed in Table 5, which are hereby incorporated by reference.Dna cross-link repair 1c (pso2 homolog, s. cerevisiae) (DCLRE1C, Accession NM_022487.1) is another GAM72 target gene, herein designated TARGET GENE. DCLRE1C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DCLRE1C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCLRE1C BINDING SITE, designated SEQ ID:10284, to the nucleotide

sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11213] Another function of GAM72 is therefore inhibition of Dna cross-link repair 1c (pso2 homolog, s. cerevisiae) (DCLRE1C, Accession NM_022487.1), a gene which intervenes in V(D)J recombination/DNA repair. and therefore may be associated with Severe combined immunodeficiency with sensitivity to ionizing radiation . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Severe combined immunodeficiency with sensitivity to ionizing radiation ., and of other diseases and clinical conditions associated with DCLRE1C.

[11214] The function of DCLRE1C has been established by previous studies. The V(D)J recombination process insures the somatic diversification of immunoglobulin- encoding and antigen T- cell receptor- encoding genes. This reaction is initiated by a DNA double- strand break, which is resolved by the ubiquitously expressed DNA repair machinery. Human T- B severe combined immunodeficiency associated with increased cellular radiosensitivity (RS- SCID; 602450) is characterized by a defect in V(D)J recombination leading to an early arrest of both B- and T- cell maturation. The RS- SCID locus maps to the short arm of chromosome 10.

By analyzing chromosome 10 BAC contigs, searching sequence databases, and RT- PCR, Moshous et al. (2001) isolated a cDNA encoding Artemis, a protein involved in V(D)J recombination/DNA repair. The predicted 685-amino acid Artemis protein has a molecular mass of 77.6 kD and is 78% identical to the murine protein. Protein sequence analysis suggested that Artemis belongs to the metallo- beta- lactamase superfamily. Northern blot and RT- PCR analyses detected ubiquitous expression of Artemis. Ma et al. (2002) reported that Artemis forms a complex with the 469- kD DNA- dependent protein kinase (PRKDS; 600899) in the absence of DNA. The purified Artemis protein alone possesses single- strand- specific 5- prime- to- 3- prime exonuclease activity. Upon complex formation, PRKDS phosphorylates Artemis, and Artemis acquires endonucleolytic activity on 5- prime and 3- prime overhangs, as well as hairpins. The Artemis-PRKDS complex can open hairpins generated by the RAG (see OMIM Ref. No. 179615) complex. Thus, PRKDC regulates Artemis by both phosphorylation and complex formation to permit enzymatic activities that are critical for the hairpin- opening step of V(D)J recombination and for the 5- prime and 3- prime overhang processing in non-

homologous DNA end joining.

[11215]

[11216] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11217] Ma, Y.; Pannicke, U.; Schwarz, K.; Lieber, M. R. : Hairpin opening and overhang processing by an Artemis/DNA-dependent protein kinase complex in nonhomologous end joining and V(D)J recombination. Cell 108: 781- 794, 2002. ; and

[11219] Further studies establishing the function and utilities of DCLRE1C are found in John Hopkins OMIM database record ID 605988, and in cited publications listed in Table 5, which are hereby incorporated by reference.DCOHM (Accession NM_032151.2) is another GAM72 target gene, herein designated TARGET GENE. DCOHM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DCOHM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DCOHM BINDING SITE, designated SEQ ID:7474, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11220] Another function of GAM72 is therefore inhibition of DCOHM (Accession NM_032151.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCOHM.

[11221] Dihydrofolate reductase (DHFR, Accession NM_000791.2) is another GAM72 target gene, herein designated TARGET GENE. DHFR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHFR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DHFR BINDING SITE, designated SEQ ID:3036, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11222] Another function of GAM72 is therefore inhibition of Dihydrofolate reductase (DHFR, Accession NM_000791.2), a gene which converts dihydrofolate into tetrahydrofolate. Accordingly, utilities of GAM72 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with DHFR.

[11223] The function of DHFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM64.1.DIS3 (Accession NM_014953.2) is another GAM72 target gene, herein designated TARGET GENE. DIS3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DIS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DIS3 BINDING SITE, designated SEQ ID:17479, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11224] Another function of GAM72 is therefore inhibition of DIS3 (Accession NM_014953.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIS3.

[11225] DJ122O8.2 (Accession NM_020466.3) is another GAM72 target gene, herein designated TARGET GENE. DJ122O8.2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DJ122O8.2, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DJ122O8.2 BINDING SITE, designated SEQ ID:4695, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11226] Another function of GAM72 is therefore inhibition of DJ122O8.2 (Accession NM_020466.3) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ122O8.2.

[11227] DKFZp434E0519 (Accession) is another GAM72 target gene, herein designated TARGET GENE. DKFZp434E0519 BINDING SITE1 and DKFZp434E0519 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DKFZp434E0519, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434E0519 BINDING SITE1 and DKFZp434E0519 BINDING SITE2, designated SEQ ID:18481 and SEQ ID:9845 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11228] Another function of GAM72 is therefore inhibition of DKFZp434E0519 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E0519.

[11229] DKFZP434F1735 (Accession NM_015590.1) is another GAM72 target gene, herein designated TARGET GENE. DKFZP434F1735 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434F1735, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434F1735 BINDING SITE, designated SEQ ID:1252, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11230] Another function of GAM72 is therefore inhibition of DKFZP434F1735 (Accession NM_015590.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F1735.

[11231] DKFZP434I1735 (Accession XM_113763.3) is another GAM72 target gene, herein designated TARGET GENE. DKFZP434I1735 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434I1735, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434I1735 BINDING SITE, designated SEQ ID:16090, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11232] Another function of GAM72 is therefore inhibition of DKFZP434I1735 (Accession XM_113763.3) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I1735.

[11233] DKFZP434N161 (Accession) is another GAM72 target gene, herein designated TARGET GENE. DKFZP434N161

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZP434N161, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434N161 BINDING SITE, designated SEQ ID:8281, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11234] Another function of GAM72 is therefore inhibition of DKFZP434N161 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N161.

[11235] DKFZp547A023 (Accession NM_018704.1) is another GAM72 target gene, herein designated TARGET GENE. DKFZp547A023 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp547A023, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547A023 BINDING SITE, designated SEQ ID:6974, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11236] Another function of GAM72 is therefore inhibition of DKFZp547A023 (Accession NM_018704.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547A023.

[11237] DKFZp547G183 (Accession NM_018705.1) is another GAM72 target gene, herein designated TARGET GENE. DKFZp547G183 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp547G183, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547G183 BINDING SITE, designated SEQ ID:12489, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11238] Another function of GAM72 is therefore inhibition of DKFZp547G183 (Accession NM_018705.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547G183.

[11239] DKFZP564A022 (Accession NM_030954.2) is another GAM72 target gene, herein designated TARGET GENE. DK-

FZP564A022 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DK-FZP564A022, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564A022 BINDING SITE, designated SEQ ID:8696, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11240] Another function of GAM72 is therefore inhibition of DK-FZP564A022 (Accession NM_030954.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564A022.

[11241] DKFZp564K142 (Accession NM_032121.1) is another GAM72 target gene, herein designated TARGET GENE. DK-FZp564K142 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DK-FZp564K142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp564K142 BINDING SITE, designated SEQ ID:8472, to the nucleotide sequence of

GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11242] Another function of GAM72 is therefore inhibition of DKFZp564K142 (Accession NM_032121.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp564K142.

[11243] DKFZP566J2046 (Accession NM_031208.1) is another GAM72 target gene, herein designated TARGET GENE. DKFZP566J2046 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP566J2046, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP566J2046 BINDING SITE, designated SEQ ID:2862, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11244] Another function of GAM72 is therefore inhibition of DKFZP566J2046 (Accession NM_031208.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566J2046.

[11245] DKFZP586D2223 (Accession) is another GAM72 target gene, herein designated TARGET GENE. DKFZP586D2223 BINDING SITE1 and DKFZP586D2223 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DKFZP586D2223, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586D2223 BINDING SITE1 and DKFZP586D2223 BINDING SITE2, designated SEQ ID:19726 and SEQ ID:5423 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11246] Another function of GAM72 is therefore inhibition of DKFZP586D2223 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586D2223.

[11247] DKFZP667O116 (Accession) is another GAM72 target gene, herein designated TARGET GENE. DKFZP667O116 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP667O116, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of DKFZP667O116 BINDING SITE, designated SEQ ID:1610, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11248] Another function of GAM72 is therefore inhibition of DKFZP667O116 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP667O116.

[11249] DKFZP761G1913 (Accession NM_031474.1) is another GAM72 target gene, herein designated TARGET GENE. DKFZP761G1913 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DKFZP761G1913, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP761G1913 BINDING SITE, designated SEQ ID:1611, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11250] Another function of GAM72 is therefore inhibition of DKFZP761G1913 (Accession NM_031474.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP761G1913.

[11251] Deoxyribonuclease ii, lysosomal (DNASE2, Accession NM_001375.1) is another GAM72 target gene, herein designated TARGET GENE. DNASE2 BINDING SITE1 and DNASE2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DNASE2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DNASE2 BINDING SITE1 and DNASE2 BINDING SITE2, designated SEQ ID:14261 and SEQ ID:1193 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11252] Another function of GAM72 is therefore inhibition of Deoxyribonuclease ii, lysosomal (DNASE2, Accession NM_001375.1), a gene which has a possible role in apoptosis. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNASE2.

[11253] The function of DNASE2 has been established by previous studies. Yasuda et al. (1992) described a specific and highly sensitive assay for urinary and leukocytic DNASE2. In both urine and leukocytes, the enzyme showed clear-

cut bimodality, and the Japanese study population could be classified into 2 distinct types, namely low- activity (DNASE2 L) and high- activity (DNASE2 H), which indicated the existence of a genetic polymorphism. Close correlations between the leukocytic and urinary enzyme activity levels from the same individuals were observed, and the types in the leukocyte samples agreed with the types found in the corresponding urine samples. In a group of 528 unrelated Japanese individuals, the gene frequencies of the low- activity allele (DNASE2*L) and the high- activity allele (DNASE2*H) were calculated to be 0.632 and 0.368, respectively. Sex and age did not affect the distribution of the DNASE2 activity levels. Family studies indicated that the low- activity type is autosomal recessive. Using RACE with primers based on the sequence of purified DNase II protein to amplify thyroid RNA, Yasuda et al. (1998) cloned the DNase II gene. The predicted 360-amino acid protein has 3 parts: a 16- amino acid signal peptide, a 91- amino acid propeptide, and a 253- amino acid mature protein region. Yasuda et al. (1998) suggested that, like other lysosomal enzymes, DNase II is processed by release of a signal peptide followed by proteolytic processing that generates a 2- chain enzyme. Pu-

rified DNase II migrates as 2 bands (32 and 12 kD) on SDS- PAGE. Using RT- PCR, Yasuda et al. (1998) found that DNase II is expressed ubiquitously.

[11254] Animal model experiments lend further support to the function of DNASE2. Mature erythrocytes in mammals have no nuclei, although they differentiate from nucleated precursor cells. Kawane et al. (2001) demonstrated that DNase II is indispensable for definitive erythropoiesis in mouse fetal liver. No live DNase II- null mice were born, owing to severe anemia. When mutant fetal liver cells were transferred into lethally irradiated wildtype mice, mature red blood cells were generated from the mutant cells, suggesting that DNase II functions in a non- cell- autonomous manner. Histochemical analyses indicated that the critical cellular sources of DNase II are macrophages present at the site of definitive erythropoiesis in the fetal liver. Thus, Kawane et al. (2001) concluded that DNase II in macrophages appears to be responsible for destroying the nuclear DNA expelled from erythroid precursor cells.

[11255] It is appreciated that the abovementioned animal model for DNASE2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[11256] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11257] Yasuda, T.; Nadano, D.; Sawazaki, K.; Kishi, K. : Genetic polymorphism of human deoxyribonuclease II (DNase II): low activity levels in urine and leukocytes are due to an autosomal recessive allele. Ann. Hum. Genet. 56: 1- 10, 1992. ; and

[11258] Yasuda, T.; Takeshita, H.; Iida, R.; Nakajima, T.; Hosomi, O.; Nakashima, Y.; Kishi, K. : Molecular cloning of the cDNA encoding human deoxyribonuclease II. J. Biol. Chem. 273: 2610- 261.

[11259] Further studies establishing the function and utilities of DNASE2 are found in John Hopkins OMIM database record ID 126350, and in cited publications listed in Table 5, which are hereby incorporated by reference.Eukaryotic translation initiation factor 2, subunit 1 alpha, 35kda (EIF2S1, Accession NM_004094.2) is another GAM72 target gene, herein designated TARGET GENE. EIF2S1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by EIF2S1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of EIF2S1 BINDING SITE, designated SEQ ID:3165, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11260] Another function of GAM72 is therefore inhibition of Eukaryotic translation initiation factor 2, subunit 1 alpha, 35kda (EIF2S1, Accession NM_004094.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2S1.

[11261] ET (Accession NM_024311.1) is another GAM72 target gene, herein designated TARGET GENE. ET BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ET, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ET BINDING SITE, designated SEQ ID:15878, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11262] Another function of GAM72 is therefore inhibition of ET (Accession NM_024311.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with ET.

[11263] Coagulation factor ii (thrombin) receptor-like 3 (F2RL3, Accession NM_003950.1) is another GAM72 target gene, herein designated TARGET GENE. F2RL3 BINDING SITE1 and F2RL3 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by F2RL3, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of F2RL3 BINDING SITE1 and F2RL3 BINDING SITE2, designated SEQ ID:16469 and SEQ ID:17466 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11264] Another function of GAM72 is therefore inhibition of Coagulation factor ii (thrombin) receptor-like 3 (F2RL3, Accession NM_003950.1), a gene which Protease- activated receptor 4; G protein- coupled receptor that increases phosphoinositide hydrolysis. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL3.

[11265] The function of F2RL3 has been established by previous studies. Protease- activated receptors 1 (PAR1; 187930), 2 (PAR2; 600933), and 3 (PAR3; 601919) are members of a

unique G protein- coupled receptor family. They are characterized by a tethered peptide ligand at the extracellular amino terminus that is generated by minor proteolysis. Xu et al. (1998) identified a partial cDNA sequence of a fourth member of this family, PAR4, in an expressed sequence tag (EST) database, and a full- length cDNA clone was isolated from a lymphoma Daudi cell cDNA library. The open reading frame coded for a 7- transmembrane domain protein of 385 amino acids with 33% amino acid sequence identity with PAR1- 3. A putative protease cleavage site was identified within the extracellular amino terminus. Northern blot analysis showed that PAR4 mRNA is expressed in a number of human tissues, with high levels being present in lung, pancreas, thyroid, testis, and small intestine. By fluorescence in situ hybridization, Xu et al. (1998) mapped the PAR4 gene to 19p12.

[11266] Animal model experiments lend further support to the function of F2RL3. Sambrano et al. (2001) demonstrated that platelets from Par4- deficient mice failed to change shape, mobilize calcium, secrete ATP, or aggregate in response to thrombin.

[11267] It is appreciated that the abovementioned animal model for F2RL3 is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[11268] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11269] Xu, W.- F.; Andersen, H.; Whitmore, T. E.; Presnell, S. R.; Yee, D. P.; Ching, A.; Gilbert, T.; Davie, E. W.; Foster, D. C. : Cloning and characterization of human protease- activated receptor 4. Proc. Nat. Acad. Sci. 95: 6642- 6646, 1998. ; and

[11270] Sambrano, G. R.; Weiss, E. J.; Zheng, Y.- W.; Huang, W.; Coughlin, S. R. : Role of thrombin signalling in platelets in haemostasis and thrombosis. Nature 413: 74- 78, 2001.

[11271] Further studies establishing the function and utilities of F2RL3 are found in John Hopkins OMIM database record ID 602779, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fanconi anemia, complementation group d2 (FANCD2, Accession NM_033084.2) is another GAM72 target gene, herein designated TARGET GENE. FANCD2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FANCD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FANCD2 BINDING SITE, designated SEQ ID:5050, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11272] Another function of GAM72 is therefore inhibition of Fanconi anemia, complementation group d2 (FANCD2, Accession NM_033084.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCD2.

[11273] F-box only protein 26 (FBXO26, Accession NM_024907.5) is another GAM72 target gene, herein designated TARGET GENE. FBXO26 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBXO26, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXO26 BINDING SITE, designated SEQ ID:1376, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11274] Another function of GAM72 is therefore inhibition of F-box only protein 26 (FBXO26, Accession NM_024907.5) .

Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO26.

[11275] F-box only protein 27 (FBXO27, Accession XM_059045.1) is another GAM72 target gene, herein designated TARGET GENE. FBXO27 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBXO27, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXO27 BINDING SITE, designated SEQ ID:4320, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11276] Another function of GAM72 is therefore inhibition of F-box only protein 27 (FBXO27, Accession XM_059045.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO27.

[11277] F-box only protein 9 (FBXO9, Accession NM_033481.1) is another GAM72 target gene, herein designated TARGET GENE. FBXO9 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of

mRNA encoded by FBXO9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXO9 BINDING SITE, designated SEQ ID:14249, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11278] Another function of GAM72 is therefore inhibition of F-box only protein 9 (FBXO9, Accession NM_033481.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO9.

[11279] Fukuyama type congenital muscular dystrophy (fukutin) (FCMD, Accession NM_006731.1) is another GAM72 target gene, herein designated TARGET GENE. FCMD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FCMD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FCMD BINDING SITE, designated SEQ ID:3598, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11280] Another function of GAM72 is therefore inhibition of Fukuyama type congenital muscular dystrophy (fukutin) (FCMD, Accession NM_006731.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCMD.

[11281] Fibroblast growth factor 2 (basic) (FGF2, Accession NM_002006.2) is another GAM72 target gene, herein designated TARGET GENE. FGF2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FGF2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:11990, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11282] Another function of GAM72 is therefore inhibition of Fibroblast growth factor 2 (basic) (FGF2, Accession NM_002006.2), a gene which the Basic fibroblast growth factor 2; is mitogenic, angiogenic, and neurotrophic factor. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2.

[11283] The function of FGF2 and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM36.1.FKSG17 (Accession NM_032031.1) is another GAM72 target gene, herein designated TARGET GENE. FKSG17 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FKSG17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FKSG17 BINDING SITE, designated SEQ ID:9662, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11284] Another function of GAM72 is therefore inhibition of FKSG17 (Accession NM_032031.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKSG17.

[11285] FLJ00060 (Accession XM_028154.2) is another GAM72 target gene, herein designated TARGET GENE. FLJ00060 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ00060, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ00060 BINDING SITE, designated SEQ ID:11930, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11286] Another function of GAM72 is therefore inhibition of FLJ00060 (Accession XM_028154.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00060.

[11287] FLJ10139 (Accession NM_018005.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ10139 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10139, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10139 BINDING SITE, designated SEQ ID:17526, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11288] Another function of GAM72 is therefore inhibition of FLJ10139 (Accession NM_018005.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10139.

[11289] FLJ10460 (Accession NM_018097.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ10460

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10460, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10460 BINDING SITE, designated SEQ ID:2166, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11290] Another function of GAM72 is therefore inhibition of FLJ10460 (Accession NM_018097.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10460.

[11291] FLJ10803 (Accession NM_018224.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ10803 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10803, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10803 BINDING SITE, designated SEQ ID:9700, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11292] Another function of GAM72 is therefore inhibition of

FLJ10803 (Accession NM_018224.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10803.

[11293] FLJ10830 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ10830 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10830, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10830 BINDING SITE, designated SEQ ID:18345, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11294] Another function of GAM72 is therefore inhibition of FLJ10830 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10830.

[11295] FLJ10891 (Accession NM_018260.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ10891 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ10891, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ10891 BINDING SITE, designated SEQ ID:2260, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11296] Another function of GAM72 is therefore inhibition of FLJ10891 (Accession NM_018260.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10891.

[11297] FLJ11016 (Accession NM_018301.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ11016 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11016, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11016 BINDING SITE, designated SEQ ID:6799, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11298] Another function of GAM72 is therefore inhibition of FLJ11016 (Accession NM_018301.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11016.

[11299] FLJ11259 (Accession NM_018370.1) is another GAM72

target gene, herein designated TARGET GENE. FLJ11259 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11259, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11259 BINDING SITE, designated SEQ ID:1365, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11300] Another function of GAM72 is therefore inhibition of FLJ11259 (Accession NM_018370.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11259.

[11301] FLJ11370 (Accession NM_024961.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ11370 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11370, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11370 BINDING SITE, designated SEQ ID:20041, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11302] Another function of GAM72 is therefore inhibition of FLJ11370 (Accession NM_024961.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11370.

[11303] FLJ11467 (Accession NM_024963.2) is another GAM72 target gene, herein designated TARGET GENE. FLJ11467 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11467, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11467 BINDING SITE, designated SEQ ID:7995, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11304] Another function of GAM72 is therefore inhibition of FLJ11467 (Accession NM_024963.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11467.

[11305] FLJ11577 (Accession NM_025159.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ11577 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11577, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11577 BINDING SITE, designated SEQ ID:13792, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11306] Another function of GAM72 is therefore inhibition of FLJ11577 (Accession NM_025159.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11577.

[11307] FLJ11715 (Accession NM_024564.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ11715 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11715, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11715 BINDING SITE, designated SEQ ID:6725, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11308] Another function of GAM72 is therefore inhibition of FLJ11715 (Accession NM_024564.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11715.

[11309] FLJ12132 (Accession NM_024980.2) is another GAM72 target gene, herein designated TARGET GENE. FLJ12132 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12132, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12132 BINDING SITE, designated SEQ ID:1822, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11310] Another function of GAM72 is therefore inhibition of FLJ12132 (Accession NM_024980.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12132.

[11311] FLJ12190 (Accession NM_025071.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ12190 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12190, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12190 BINDING SITE, designated SEQ ID:15565, to the nucleotide sequence of GAM72 RNA, herein designated

GAM RNA, also designated SEQ ID:342.

[11312] Another function of GAM72 is therefore inhibition of FLJ12190 (Accession NM_025071.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12190.

[11313] FLJ12294 (Accession NM_025100.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ12294 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ12294, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12294 BINDING SITE, designated SEQ ID:18537, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11314] Another function of GAM72 is therefore inhibition of FLJ12294 (Accession NM_025100.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12294.

[11315] FLJ12409 (Accession NM_025105.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ12409 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12409, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12409 BINDING SITE, designated SEQ ID:19647, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11316] Another function of GAM72 is therefore inhibition of FLJ12409 (Accession NM_025105.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12409.

[11317] FLJ12448 (Accession NM_022895.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ12448 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12448, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12448 BINDING SITE, designated SEQ ID:1090, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11318] Another function of GAM72 is therefore inhibition of FLJ12448 (Accession NM_022895.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ12448.

[11319] FLJ12671 (Accession NM_030980.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ12671 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12671, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12671 BINDING SITE, designated SEQ ID:8146, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11320] Another function of GAM72 is therefore inhibition of FLJ12671 (Accession NM_030980.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12671.

[11321] FLJ12921 (Accession NM_024875.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ12921 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12921, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12921 BINDING SITE, designated SEQ ID:17641, to the

nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11322] Another function of GAM72 is therefore inhibition of FLJ12921 (Accession NM_024875.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12921.

[11323] FLJ13193 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ13193 BINDING SITE1 and FLJ13193 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ13193, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13193 BINDING SITE1 and FLJ13193 BINDING SITE2, designated SEQ ID:19618 and SEQ ID:6059 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11324] Another function of GAM72 is therefore inhibition of FLJ13193 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13193.

[11325] FLJ13330 (Accession NM_025091.2) is another GAM72

target gene, herein designated TARGET GENE. FLJ13330 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13330, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13330 BINDING SITE, designated SEQ ID:15073, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11326] Another function of GAM72 is therefore inhibition of FLJ13330 (Accession NM_025091.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13330.

[11327] FLJ13352 (Accession NM_024592.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ13352 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13352, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13352 BINDING SITE, designated SEQ ID:9233, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11328] Another function of GAM72 is therefore inhibition of FLJ13352 (Accession NM_024592.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13352.

[11329] FLJ13390 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ13390 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13390, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13390 BINDING SITE, designated SEQ ID:19961, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11330] Another function of GAM72 is therefore inhibition of FLJ13390 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13390.

[11331] FLJ13456 (Accession XM_038291.5) is another GAM72 target gene, herein designated TARGET GENE. FLJ13456 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13456, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13456 BINDING SITE, designated SEQ ID:13553, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11332] Another function of GAM72 is therefore inhibition of FLJ13456 (Accession XM_038291.5) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13456.

[11333] FLJ13544 (Accession NM_025008.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ13544 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13544, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13544 BINDING SITE, designated SEQ ID:17984, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11334] Another function of GAM72 is therefore inhibition of FLJ13544 (Accession NM_025008.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13544.

[11335] FLJ13621 (Accession NM_025009.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ13621 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13621, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13621 BINDING SITE, designated SEQ ID:1377, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11336] Another function of GAM72 is therefore inhibition of FLJ13621 (Accession NM_025009.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13621.

[11337] FLJ13848 (Accession NM_024771.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ13848 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ13848, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13848 BINDING SITE, designated SEQ ID:3884, to the nucleotide sequence of GAM72 RNA, herein designated

GAM RNA, also designated SEQ ID:342.

[11338] Another function of GAM72 is therefore inhibition of FLJ13848 (Accession NM_024771.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13848.

[11339] FLJ13984 (Accession NM_024770.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ13984 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13984, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13984 BINDING SITE, designated SEQ ID:11483, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11340] Another function of GAM72 is therefore inhibition of FLJ13984 (Accession NM_024770.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13984.

[11341] FLJ14011 (Accession NM_022103.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ14011 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14011, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14011 BINDING SITE, designated SEQ ID:9324, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11342] Another function of GAM72 is therefore inhibition of FLJ14011 (Accession NM_022103.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14011.

[11343] FLJ14082 (Accession NM_025024.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ14082 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14082, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14082 BINDING SITE, designated SEQ ID:6567, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11344] Another function of GAM72 is therefore inhibition of FLJ14082 (Accession NM_025024.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ14082.

[11345] FLJ14251 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ14251 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ14251, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14251 BINDING SITE, designated SEQ ID:2884, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11346] Another function of GAM72 is therefore inhibition of FLJ14251 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14251.

[11347] FLJ14280 (Accession NM_024886.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ14280 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14280, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14280 BINDING SITE, designated SEQ ID:15839, to the

nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11348] Another function of GAM72 is therefore inhibition of FLJ14280 (Accession NM_024886.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14280.

[11349] FLJ14326 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ14326 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14326, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14326 BINDING SITE, designated SEQ ID:18652, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11350] Another function of GAM72 is therefore inhibition of FLJ14326 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14326.

[11351] FLJ14327 (Accession NM_024912.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ14327 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ14327, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14327 BINDING SITE, designated SEQ ID:1971, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11352] Another function of GAM72 is therefore inhibition of FLJ14327 (Accession NM_024912.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14327.

[11353] FLJ14397 (Accession NM_032779.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ14397 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14397, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14397 BINDING SITE, designated SEQ ID:16157, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11354] Another function of GAM72 is therefore inhibition of FLJ14397 (Accession NM_032779.1) . Accordingly, utilities

of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14397.

[11355] FLJ14399 (Accession NM_032780.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ14399 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14399, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14399 BINDING SITE, designated SEQ ID:2000, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11356] Another function of GAM72 is therefore inhibition of FLJ14399 (Accession NM_032780.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14399.

[11357] FLJ14457 (Accession NM_032788.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ14457 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14457, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ14457 BINDING SITE, designated SEQ ID:6993, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11358] Another function of GAM72 is therefore inhibition of FLJ14457 (Accession NM_032788.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14457.

[11359] FLJ14466 (Accession NM_032790.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ14466 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14466, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14466 BINDING SITE, designated SEQ ID:12835, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11360] Another function of GAM72 is therefore inhibition of FLJ14466 (Accession NM_032790.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14466.

[11361] FLJ20004 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ20004 BINDING SITE1

and FLJ20004 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ20004, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20004 BINDING SITE1 and FLJ20004 BINDING SITE2, designated SEQ ID:16023 and SEQ ID:19735 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11362] Another function of GAM72 is therefore inhibition of FLJ20004 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20004.

[11363] FLJ20006 (Accession NM_017618.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ20006 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20006, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20006 BINDING SITE, designated SEQ ID:9107, to the nucleotide sequence of GAM72 RNA, herein designated

GAM RNA, also designated SEQ ID:342.

[11364] Another function of GAM72 is therefore inhibition of FLJ20006 (Accession NM_017618.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20006.

[11365] FLJ20013 (Accession NM_017621.2) is another GAM72 target gene, herein designated TARGET GENE. FLJ20013 BINDING SITE1 and FLJ20013 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ20013, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20013 BINDING SITE1 and FLJ20013 BINDING SITE2, designated SEQ ID:3892 and SEQ ID:4741 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11366] Another function of GAM72 is therefore inhibition of FLJ20013 (Accession NM_017621.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20013.

[11367] FLJ20045 (Accession NM_017638.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ20045

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20045 BINDING SITE, designated SEQ ID:10035, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11368] Another function of GAM72 is therefore inhibition of FLJ20045 (Accession NM_017638.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20045.

[11369] FLJ20059 (Accession NM_017644.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ20059 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20059, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20059 BINDING SITE, designated SEQ ID:9258, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11370] Another function of GAM72 is therefore inhibition of

FLJ20059 (Accession NM_017644.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20059.

[11371] FLJ20069 (Accession NM_017651.2) is another GAM72 target gene, herein designated TARGET GENE. FLJ20069 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20069, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20069 BINDING SITE, designated SEQ ID:11616, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11372] Another function of GAM72 is therefore inhibition of FLJ20069 (Accession NM_017651.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20069.

[11373] FLJ20139 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ20139 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20139, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of FLJ20139 BINDING SITE, designated SEQ ID:12730, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11374] Another function of GAM72 is therefore inhibition of FLJ20139 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20139.

[11375] FLJ20174 (Accession NM_017699.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ20174 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20174, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20174 BINDING SITE, designated SEQ ID:14813, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11376] Another function of GAM72 is therefore inhibition of FLJ20174 (Accession NM_017699.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20174.

[11377] FLJ20200 (Accession NM_017708.1) is another GAM72

target gene, herein designated TARGET GENE. FLJ20200 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20200, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20200 BINDING SITE, designated SEQ ID:2707, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11378] Another function of GAM72 is therefore inhibition of FLJ20200 (Accession NM_017708.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20200.

[11379] FLJ20340 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ20340 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20340, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20340 BINDING SITE, designated SEQ ID:19249, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11380] Another function of GAM72 is therefore inhibition of FLJ20340 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20340.

[11381] FLJ20413 (Accession NM_017808.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ20413 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20413, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20413 BINDING SITE, designated SEQ ID:16863, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11382] Another function of GAM72 is therefore inhibition of FLJ20413 (Accession NM_017808.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20413.

[11383] FLJ20464 (Accession NM_017834.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ20464 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20464, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20464 BINDING SITE, designated SEQ ID:402, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11384] Another function of GAM72 is therefore inhibition of FLJ20464 (Accession NM_017834.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20464.

[11385] FLJ20546 (Accession NM_017872.2) is another GAM72 target gene, herein designated TARGET GENE. FLJ20546 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20546, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20546 BINDING SITE, designated SEQ ID:17595, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11386] Another function of GAM72 is therefore inhibition of FLJ20546 (Accession NM_017872.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20546.

[11387] FLJ20694 (Accession NM_017928.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ20694 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20694, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20694 BINDING SITE, designated SEQ ID:16458, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11388] Another function of GAM72 is therefore inhibition of FLJ20694 (Accession NM_017928.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20694.

[11389] FLJ20700 (Accession NM_017932.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ20700 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20700, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20700 BINDING SITE, designated SEQ ID:13236, to the nucleotide sequence of GAM72 RNA, herein designated

GAM RNA, also designated SEQ ID:342.

[11390] Another function of GAM72 is therefore inhibition of FLJ20700 (Accession NM_017932.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20700.

[11391] FLJ20783 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ20783 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20783, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20783 BINDING SITE, designated SEQ ID:13950, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11392] Another function of GAM72 is therefore inhibition of FLJ20783 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20783.

[11393] FLJ20808 (Accession NM_017960.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ20808 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20808, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20808 BINDING SITE, designated SEQ ID:991, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11394] Another function of GAM72 is therefore inhibition of FLJ20808 (Accession NM_017960.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20808.

[11395] FLJ20825 (Accession NM_017962.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ20825 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20825, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20825 BINDING SITE, designated SEQ ID:14966, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11396] Another function of GAM72 is therefore inhibition of FLJ20825 (Accession NM_017962.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ20825.

[11397] FLJ21106 (Accession NM_025097.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ21106 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ21106, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21106 BINDING SITE, designated SEQ ID:7533, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11398] Another function of GAM72 is therefore inhibition of FLJ21106 (Accession NM_025097.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21106.

[11399] FLJ21162 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ21162 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ21162, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21162 BINDING SITE, designated SEQ ID:9315, to the nucleotide

sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11400] Another function of GAM72 is therefore inhibition of FLJ21162 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21162.

[11401] FLJ21272 (Accession NM_025032.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ21272 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21272, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21272 BINDING SITE, designated SEQ ID:2503, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11402] Another function of GAM72 is therefore inhibition of FLJ21272 (Accession NM_025032.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21272.

[11403] FLJ21369 (Accession NM_024802.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ21369 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by FLJ21369, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21369 BINDING SITE, designated SEQ ID:18241, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11404] Another function of GAM72 is therefore inhibition of FLJ21369 (Accession NM_024802.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21369.

[11405] FLJ21551 (Accession NM_024801.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ21551 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21551, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21551 BINDING SITE, designated SEQ ID:6940, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11406] Another function of GAM72 is therefore inhibition of FLJ21551 (Accession NM_024801.1) . Accordingly, utilities

of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21551.

[11407] FLJ22009 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ22009 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22009, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22009 BINDING SITE, designated SEQ ID:1350, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11408] Another function of GAM72 is therefore inhibition of FLJ22009 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22009.

[11409] FLJ22474 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ22474 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22474, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22474

BINDING SITE, designated SEQ ID:17883, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11410] Another function of GAM72 is therefore inhibition of FLJ22474 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22474.

[11411] FLJ22692 (Accession NM_025049.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ22692 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22692, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22692 BINDING SITE, designated SEQ ID:16683, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11412] Another function of GAM72 is therefore inhibition of FLJ22692 (Accession NM_025049.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22692.

[11413] FLJ22814 (Accession NM_024916.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ22814

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ22814, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22814 BINDING SITE, designated SEQ ID:458, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11414] Another function of GAM72 is therefore inhibition of FLJ22814 (Accession NM_024916.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22814.

[11415] FLJ23040 (Accession NM_025174.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ23040 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23040, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23040 BINDING SITE, designated SEQ ID:15539, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11416] Another function of GAM72 is therefore inhibition of

FLJ23040 (Accession NM_025174.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23040.

[11417] FLJ23042 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ23042 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23042, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23042 BINDING SITE, designated SEQ ID:1823, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11418] Another function of GAM72 is therefore inhibition of FLJ23042 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23042.

[11419] FLJ23112 (Accession NM_024929.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ23112 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23112, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ23112 BINDING SITE, designated SEQ ID:11044, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11420] Another function of GAM72 is therefore inhibition of FLJ23112 (Accession NM_024929.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23112.

[11421] FLJ23120 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ23120 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23120, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23120 BINDING SITE, designated SEQ ID:18218, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11422] Another function of GAM72 is therefore inhibition of FLJ23120 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23120.

[11423] FLJ23476 (Accession NM_024640.1) is another GAM72

target gene, herein designated TARGET GENE. FLJ23476 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23476, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23476 BINDING SITE, designated SEQ ID:8812, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11424] Another function of GAM72 is therefore inhibition of FLJ23476 (Accession NM_024640.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23476.

[11425] FLJ23499 (Accession NM_022761.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ23499 BINDING SITE1 and FLJ23499 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ23499, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23499 BINDING SITE1 and FLJ23499 BINDING SITE2, designated SEQ ID:10255 and SEQ ID:10849 respectively, to the nucleotide sequence of

GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11426] Another function of GAM72 is therefore inhibition of FLJ23499 (Accession NM_022761.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23499.

[11427] FLJ23537 (Accession NM_024889.1) is another GAM72 target gene, herein designated TARGET GENE. FLJ23537 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23537, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23537 BINDING SITE, designated SEQ ID:6332, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11428] Another function of GAM72 is therefore inhibition of FLJ23537 (Accession NM_024889.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23537.

[11429] FLJ25012 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ25012 BINDING SITE is a target binding site found in the 3` untranslated re-

gion of mRNA encoded by FLJ25012, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ25012 BINDING SITE, designated SEQ ID:19167, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11430] Another function of GAM72 is therefore inhibition of FLJ25012 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25012.

[11431] FLJ30681 (Accession XM_166291.2) is another GAM72 target gene, herein designated TARGET GENE. FLJ30681 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30681, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30681 BINDING SITE, designated SEQ ID:6277, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11432] Another function of GAM72 is therefore inhibition of FLJ30681 (Accession XM_166291.2) . Accordingly, utilities

of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30681.

[11433] FLJ31168 (Accession) is another GAM72 target gene, herein designated TARGET GENE. FLJ31168 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ31168, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ31168 BINDING SITE, designated SEQ ID:12604, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11434] Another function of GAM72 is therefore inhibition of FLJ31168 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31168.

[11435] Fibronectin leucine rich transmembrane protein 2 (FLRT2, Accession NM_013231.2) is another GAM72 target gene, herein designated TARGET GENE. FLRT2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLRT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:10151, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11436] Another function of GAM72 is therefore inhibition of Fibronectin leucine rich transmembrane protein 2 (FLRT2, Accession NM_013231.2), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2.

[11437] The function of FLRT2 has been established by previous studies. The FLRT family of proteins structurally resembles small leucine- rich proteoglycans found in the extracellular matrix. By screening human brain cDNAs for the potential to encode proteins that are at least 50 kD, Ishikawa et al. (1997) isolated a FLRT2 cDNA, which they called KIAA0405. The deduced 660- amino acid full- length FLRT2 protein shares 25% amino acid sequence identity with the precursor of the alpha chain of human platelet glycoprotein Ib (GP1BA; OMIM Ref. No. 231200) across 180 residues. By SDS- PAGE, in vitro transcribed/translated FLRT2 had an apparent molecular mass of approxi-

mately 75 kD. RT- PCR detected FLRT2 expression in a number of human tissues, with highest expression in ovary and relatively high expression in brain and pancreas. By searching a human EST database with portions of the FLRT1 protein (OMIM Ref. No. 604806) sequence, Lacy et al. (1999) identified ESTs encoding FLRT2. The full- length FLRT2 coding sequence encodes a predicted 660- amino acid protein containing a putative N- terminal signal sequence, 10 leucine- rich repeats (LRRs) flanked by N- and C- terminal cysteine- rich regions, a fibronectin- /collagen- like domain, a transmembrane domain, and an intracellular C- terminal tail. FLRT2 has 5 potential N- glycosylation sites in its extracellular region. FLRT2 shares 44% amino acid sequence identity with FLRT3 (OMIM Ref. No. 604808) and 41% identity with FLRT1. Recombinant FLRT2 expressed in SF9 insect cells and monkey COS- 1 cells migrated as an 85- kD protein on SDS- polyacrylamide gels. The authors demonstrated that FLRT2 is glycosylated. Northern blot analysis of a variety of human adult tissues detected a 7.5- kb FLRT2 transcript that was expressed abundantly in pancreas and less abundantly in skeletal muscle, brain, and heart. Lacy et al. (1999) suggested that FLRT2 functions in cell adhe-

sion and/or receptor signaling. By analysis of a radiation hybrid mapping panel, Ishikawa et al. (1997) mapped the FLRT2 gene to chromosome 14. Lacy et al. (1999) noted that a UniGene cluster corresponding to the FLRT2 gene has been mapped to 14q24- q32.

[11438]

[11439] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11440] Ishikawa, K.; Nagase, T.; Nakajima, D.; Seki, N.; Ohira, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. VIII. 78 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 4: 307- 313, 1997. ; and

[11441] Lacy, S. E.; Bonnemann, C. G.; Buzney, E. A.; Kunkel, L. M. : Identification of FLRT1, FLRT2, and FLRT3: a novel family of transmembrane leucine- rich repeat proteins. Genomics 62: 417- 4.

[11442] Further studies establishing the function and utilities of FLRT2 are found in John Hopkins OMIM database record ID 604807, and in cited publications listed in Table 5, which are hereby incorporated by refer-

ence.Udp-n-acetyl-alpha-d-galactosamine:polypeptide n-acetylgalactosaminyltransferase 3 (galnac-t3) (GALNT3, Accession NM_004482.2) is another GAM72 target gene, herein designated TARGET GENE. GALNT3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GALNT3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GALNT3 BINDING SITE, designated SEQ ID:2190, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11443] Another function of GAM72 is therefore inhibition of Udp-n-acetyl-alpha-d-galactosamine:polypeptide n-acetylgalactosaminyltransferase 3 (galnac-t3) (GALNT3, Accession NM_004482.2), a gene which initiates O- glycosylation of serine and threonine residues. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT3.

[11444] The function of GALNT3 has been established by previous studies. GALNT3 (EC 2.4.1.41) is one of several enzymes that catalyze the reaction UDP- GalNAc + polypeptide-

(Ser/Thr)- OH to GalNAc- alpha- O- Ser/Thr- polypeptide + UDP, thereby initiating O- glycosylation of serine and threonine residues on an array of glycoproteins. Bennett et al. (1996) used degenerate PCR to clone human GALNT3 using primers based on the sequences of GALNT1 (OMIM Ref. No. 602273) and GALNT2 (OMIM Ref. No. 602274). GALNT3 encodes a 633- amino acid protein which has a single membrane- spanning region and is highly homologous to GALNT1 and GALNT2. Northern blot analysis showed that GALNT3 is expressed as a 3.6- kb transcript, with highest levels in human pancreas and testis. Bennett et al. (1996) expressed the gene in insect Sf9 cells and showed that GALNT3 does have GalNAc-transferase activity, but with different substrate specificity than GALNT1 or GALNT2. The mouse ortholog of GalNAc-T3 was cloned by Zara et al. (1996). Bennett et al. (1998) found that the GALNT1, GALNT2, and GALNT3 genes contain 11, 16, and 10 exons, respectively. Several intron/exon boundaries are conserved within the 3 genes. By FISH, Bennett et al. (1998) mapped the GALNT3 gene to human chromosome 2q24- q31.

[11445]

[11446] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[11447] Bennett, E. P.; Hassan, H.; Clausen, H. : cDNA cloning and expression of a novel human UDP- N- acetyl- alpha- D- galactosamine. J. Biol. Chem. 271: 17006- 17012, 1996. ; and

[11448] Bennett, E. P.; Weghuis, D. O.; Merkx, G.; Geurts van Kessel, A.; Eiberg, H.; Clausen, H. : Genomic organization and chromosomal localization of three members of the UDP- N- acetylgalacto.

[11449] Further studies establishing the function and utilities of GALNT3 are found in John Hopkins OMIM database record ID 601756, and in cited publications listed in Table 5, which are hereby incorporated by refer- ence.Udp-n-acetyl-alpha-d-galactosamine:polypeptide n-acetylgalactosaminyltransferase 6 (galnac-t6) (GALNT6, Accession NM_007210.2) is another GAM72 target gene, herein designated TARGET GENE. GALNT6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GALNT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple- mentarity of the nucleotide sequences of GALNT6 BIND-

ING SITE, designated SEQ ID:14948, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11450] Another function of GAM72 is therefore inhibition of Udp-n-acetyl-alpha-d-galactosamine:polypeptide n-acetylgalactosaminyltransferase 6 (galnac-t6) (GALNT6, Accession NM_007210.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT6.

[11451] Growth arrest-specific 7 (GAS7, Accession NM_005890.1) is another GAM72 target gene, herein designated TARGET GENE. GAS7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GAS7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAS7 BINDING SITE, designated SEQ ID:17657, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11452] Another function of GAM72 is therefore inhibition of Growth arrest-specific 7 (GAS7, Accession NM_005890.1), a gene which may play a role in promoting maturation and

morphological differentiation of cerebellar neurons. and therefore may be associated with Leukemias with myeloid/lymphoid (mll). Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Leukemias with myeloid/lymphoid (mll), and of other diseases and clinical conditions associated with GAS7.

[11453] The function of GAS7 has been established by previous studies. Growth arrest- specific (GAS) genes are expressed preferentially in cells that enter a quiescent state. Ju et al. (1998) described the isolation and characterization of a GAS gene (GAS7) that is expressed primarily in vivo in terminally differentiated brain cells and particularly prominently in mature cerebellar Purkinje neurons. The gene had originally been identified in serum- starved murine fibroblasts. GAS7 transcripts encode a 48- kD protein containing a structural domain that resembles sequences of OCT2 (OMIM Ref. No. 602608), a POU transcription factor implicated in neuronal development, and synapsins, e.g., synapsin I (SYN1; 313440), which have a role in modulating neurotransmitter release. Using in situ hybridization and immunocytochemical analysis, Ju et al. (1998) showed that inhibition of production of GAS7 in terminally differentiating cultures of embryonic murine

cerebellum impedes neurite outgrowth from maturing Purkinje cells. Conversely, GAS7 overexpression in undifferentiated neuroblastoma cell cultures dramatically promotes neurite- like outgrowth. Collectively, the results provided evidence for an association between expression of GAS7 and neuronal development. By analysis of cell hybrid DNAs prepared from a panel of 21 Chinese hamster/ mouse hybrid cell lines, Ju et al. (1998) mapped the mouse Gas7 gene to chromosome 11. They reported that a human DNA fragment (GenBank G13706) having 85% sequence identity with Gas7 mapped to 17p, which is largely syngeneic with mouse chromosome 11 (Kurtz and Zimmer, 1995).

[11454]

[11455] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11456] Ju, Y.- T.; Chang, A. C. Y.; She, B.- R.; Tsaur, M.- L.; Hwang, H.- M.; Chao, C. C.- K.; Cohen, S. N.; Lin- Chao, S. : Gas7: a gene expressed preferentially in growth- arrested fibroblasts and terminally differentiated Purkinje neurons affects neurite formation. Proc. Nat. Acad. Sci. 95: 11423- 11428, 1998. ; and

[11457] Kurtz, A.; Zimmer, A. : Interspecies fluorescence in situ hybridization further defines synteny homology between mouse chromosome 11 and human chromosome 17. Mammalian Genome 6: 379- 380.

[11458] Further studies establishing the function and utilities of GAS7 are found in John Hopkins OMIM database record ID 603127, and in cited publications listed in Table 5, which are hereby incorporated by reference.GCN2 (Accession) is another GAM72 target gene, herein designated TARGET GENE. GCN2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GCN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GCN2 BINDING SITE, designated SEQ ID:11455, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11459] Another function of GAM72 is therefore inhibition of GCN2 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCN2.

[11460] Golgi associated, gamma adaptin ear containing, arf binding protein 2 (GGA2, Accession NM_015044.2) is another

GAM72 target gene, herein designated TARGET GENE. GGA2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GGA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE, designated SEQ ID:16227, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11461] Another function of GAM72 is therefore inhibition of Golgi associated, gamma adaptin ear containing, arf binding protein 2 (GGA2, Accession NM_015044.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2.

[11462] G protein-coupled receptor kinase 7 (GPRK7, Accession NM_139209.1) is another GAM72 target gene, herein designated TARGET GENE. GPRK7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GPRK7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPRK7 BINDING SITE, designated

SEQ ID:5505, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11463] Another function of GAM72 is therefore inhibition of G protein-coupled receptor kinase 7 (GPRK7, Accession NM_139209.1), a gene which regulates the G protein-coupled receptors. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPRK7.

[11464] The function of GPRK7 has been established by previous studies. By PCR on neutrophil cDNA using primers based on sequences of known receptor kinases, Haribabu and Snyderman (1993) identified sequences for GPRK5 (OMIM Ref. No. 600870), GPRK6 (OMIM Ref. No. 600869), and what they believed to be GPRK7. The sequence designated GPRK7 showed the least homology to known receptor kinases and was later determined to match the sequence of mitogen- activated protein kinase- interacting serine/ threonine kinase- 2 (MKNK2). MKNK2 contains conserved DLG (asp- leu- gly) and ENIL (glu- asn- ile- leu) motifs. Using a 2- hybrid screen for Erk2 (MAPK1; 176948)- binding proteins, Waskiewicz et al. (1997) identified mouse Mnk2 and isolated a full- length cDNA clone from a mouse embryo cDNA library. Mnk2 has a conserved C-

terminal Erk- interacting domain, a catalytic domain with homology to the calcium/calmodulin- dependent family of kinases, and putative MAP kinase phosphorylation sites located within the T loop of the kinase domain. Northern blot analysis detected Mnk2 expression in all adult mouse tissues tested except brain, where levels were greatly reduced. Expression was especially abundant in skeletal muscle.

[11465]

[11466] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11467] Haribabu, B.; Snyderman, R. : Identification of additional members of human G- protein- coupled receptor kinase multigene family. Proc. Nat. Acad. Sci. 90: 9398- 9402, 1993. ; and

[11469] Further studies establishing the function and utilities of GPRK7 are found in John Hopkins OMIM database record ID 605069, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Huntingtin interacting protein 1 (HIP1, Accession NM_005338.3) is another GAM72 target gene, herein designated TARGET GENE. HIP1 BINDING SITE1 and HIP1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by HIP1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HIP1 BINDING SITE1 and HIP1 BINDING SITE2, designated SEQ ID:17600 and SEQ ID:14256 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11470] Another function of GAM72 is therefore inhibition of Huntingtin interacting protein 1 (HIP1, Accession NM_005338.3), a gene which is a membrane protein and interacts with huntingtin. and therefore may be associated with Huntington disease. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Huntington disease, and of other diseases and clinical conditions associated with HIP1.

[11471] The function of HIP1 has been established by previous studies. Huntington disease (HD; 143100) may be due to a

toxic gain- of- function caused by abnormal protein-protein interactions related to the elongated polyglutamine sequence of huntingtin. Thus, the binding of distinct proteins to the polyglutamine region could either confer a new property on huntingtin or alter its normal interactions with other proteins. Wanker et al. (1997) hypothesized that the specific binding of a protein with a restricted pattern of expression to the elongated polyglutamine stretch of the huntingtin protein could cause selective vulnerability to particular cells. The potential huntingtin- interacting proteins that have been identified include huntingtin- associated protein- 1 (OMIM Ref. No. 600947), the glycolytic enzyme GAPD (OMIM Ref. No. 138400), and the ubiquitin- conjugating enzyme E2- 25K, also named HIP2 (OMIM Ref. No. 602846), which binds selectively to the N terminus of huntingtin. Wanker et al. (1997) demonstrated the specific binding of a protein to the N terminus of huntingtin, both in the yeast 2- hybrid screen and in in vitro binding experiments. A protein region downstream of the polyglutamine stretch in huntingtin was essential for the interaction in vitro. Thus, the authors designated the new protein 'huntingtin- interacting protein- 1' (HIP1). The HIP1 cDNA isolated by the 2-

hybrid screen encodes a 55- kD fragment of the novel protein. Using an affinity- purified polyclonal antibody raised against recombinant HIP1, a protein of 116 kD was detected in brain extracts by Western blot analysis. The predicted amino acid sequence of the HIP1 fragment exhibited significant similarity to cytoskeleton proteins, suggesting to Wanker et al. (1997) that HIP1 and huntingtin play a functional role in the cell filament network. The HIP1 gene was found to be ubiquitously expressed at low levels in different brain regions. HIP1 is enriched in human brain but can also be detected in other human tissues, as well as in mouse brain. The authors noted that HIP1 and huntingtin behave almost identically during subcellular fractionation and both proteins are enriched in the membrane- containing fractions.

[11472] Animal model experiments lend further support to the function of HIP1. Kalchman et al. (1997) showed that HIP1 is a membrane- associated protein that colocalizes with huntingtin and shares sequence homology and biochemical characteristics with Sla2p, a protein essential for function of the cytoskeleton in S. cerevisiae. The huntingtin-HIP1 interaction was restricted to the brain and correlated inversely with the polyglutamine length in huntingtin.

Their results provided a molecular link between huntingtin and the neuronal cytoskeleton and suggested that, in Huntington disease, loss of normal huntingtin- HIP1 interaction may contribute to a defect in membrane- cytoskeletal integrity in the brain.

[11473] It is appreciated that the abovementioned animal model for HIP1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[11474] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11475] Kalchman, M. A.; Koide, H. B.; McCutcheon, K.; Graham, R. K.; Nichol, K.; Nishiyama, K.; Kazemi- Esfarjani, P.; Lynn, F. C.; Wellington, C.; Metzler, M.; Goldberg, Y. P.; Kanazawa, I.; Gietz, R. D.; Hayden, M. R. : HIP1, a human homologue of S. cerevisiae Slap2, interacts with membrane- associated huntingtin in the brain. Nature Genet. 16: 44- 53, 1997. ; and

[11476] Wanker, E. E.; Rovira, C.; Scherzinger, E.; Hasenbank, R.; Walter, S.; Tait, D.; Colicelli, J.; Lehrach, H. : HIP- I: a huntingtin interacting protein isolated by the yeast two-hybrid sys.

[11477] Further studies establishing the function and utilities of HIP1 are found in John Hopkins OMIM database record ID 601767, and in cited publications listed in Table 5, which are hereby incorporated by reference.Major histocompatibility complex, class i, e (HLA-E, Accession NM_005516.3) is another GAM72 target gene, herein designated TARGET GENE. HLA-E BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HLA-E, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HLA-E BINDING SITE, designated SEQ ID:1460, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11478] Another function of GAM72 is therefore inhibition of Major histocompatibility complex, class i, e (HLA-E, Accession NM_005516.3), a gene which involves in NK cell-mediated lysis. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLA-E.

[11479] The function of HLA-E has been established by previous studies. O'Callaghan et al. (1998) determined the crystal structure of human HLA- E in complex with a prototypic

ligand, the nonamer peptide (VMAPRTVLL), derived from the highly conserved residues 3- 11 of the human MHC class Ia leader sequence. The mode of peptide binding retained some of the standard features observed in MHC class Ia complexes, but novel features implied that HLA- E has evolved to mediate specific binding to a tightly defined set of almost identical hydrophobic peptides from the highly conserved class I leader sequences. These molecular adaptations make HLA- E a rigorous checkpoint at the cell surface, reporting on the integrity of the antigen processing pathway to CD94/NKG2 receptor- bearing natural killer cells. The protein HLA- E is a nonclassical MHC molecule of limited sequence variability. Its expression on the cell surface is regulated by the binding of peptides derived from the signal sequence of some other MHC class I molecules. Braud et al. (1998) reported the identification of ligands for HLA- E. Braud et al. (1998) constructed tetramers in which recombinant HLA- E and beta- 2 microglobulin were refolded with an MHC leader-sequence peptide, biotinylated, and conjugated to Extravidin. This HLA- E tetramer bound to natural killer (NK) cells and a small subset of T cells from peripheral blood. On transfectants, the tetramer bound to the CD94/NKG2A

(OMIM Ref. No. 161555), CD94/NKG2B, and CD94/NKG2C (OMIM Ref. No. 602891) NK cell receptors, but did not bind to the immunoglobulin family of NK cell receptors (KIRs; OMIM Ref. No. 604936). Surface expression of HLA-E was enough to protect target cells from lysis by CD94/NKG2A+ NK cell clones. A subset of HLA class I alleles had been shown to inhibit killing by CD94/NKG2A+ NK cell clones. Only the HLA alleles that possess a leader peptide capable of upregulating HLA- E surface expression confer resistance to NK cell- mediated lysis, implying that their action is mediated by HLA- E, the predominant ligand for the NK cell inhibitory receptor CD94/NKG2A.

[11480]

T.; Bell, J. I.; Phillips, J. H.; Lanier, L. L.; McMichael, A. J. : HL.

[11484] Further studies establishing the function and utilities of HLA-E are found in John Hopkins OMIM database record ID 143010, and in cited publications listed in Table 5, which are hereby incorporated by reference.HSC3 (Accession NM_145174.1) is another GAM72 target gene, herein designated TARGET GENE. HSC3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSC3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSC3 BINDING SITE, designated SEQ ID:2408, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11485] Another function of GAM72 is therefore inhibition of HSC3 (Accession NM_145174.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSC3.

[11486] HSH2 (Accession NM_032855.1) is another GAM72 target gene, herein designated TARGET GENE. HSH2 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by HSH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSH2 BINDING SITE, designated SEQ ID:5998, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11487] Another function of GAM72 is therefore inhibition of HSH2 (Accession NM_032855.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSH2.

[11488] HSMPP8 (Accession XM_167894.2) is another GAM72 target gene, herein designated TARGET GENE. HSMPP8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSMPP8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSMPP8 BINDING SITE, designated SEQ ID:11227, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11489] Another function of GAM72 is therefore inhibition of HSMPP8 (Accession XM_167894.2) . Accordingly, utilities

of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSMPP8.

[11490] Heat shock 70kda protein 5 (glucose-regulated protein, 78kda) (HSPA5, Accession NM_005347.2) is another GAM72 target gene, herein designated TARGET GENE. HSPA5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSPA5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSPA5 BINDING SITE, designated SEQ ID:3420, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11491] Another function of GAM72 is therefore inhibition of Heat shock 70kda protein 5 (glucose-regulated protein, 78kda) (HSPA5, Accession NM_005347.2), a gene which is involved in the folding and assembly of proteins in the endoplasmic reticulum (ER). Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPA5.

[11492] The function of HSPA5 has been established by previous studies. Hendershot et al. (1994) pointed out that GRP78, also referred to as 'immunoglobulin heavy chain- binding

protein' (BiP), is a member of the heat- shock protein- 70 (HSP70) family and is involved in the folding and assembly of proteins in the endoplasmic reticulum (ER). Because so many ER proteins interact with GRP78 transiently, it may play a key role in monitoring protein transport through the cell. To examine how the binding of BiP influences the conformational maturation of thyroglobulin (TG; 188450), Muresan and Arvan (1998) expressed TG in Chinese hamster ovary (CHO) cells genetically manipulated for selectively increased BiP expression (CHO- B cells). The TG expressed in CHO- B cells did not contain any mutations that induce misfolding (i.e., no unfolded protein response), so that levels of all other ER chaperones were normal. Increased availability of BiP did not accelerate TG secretion; rather, the export of newly synthesized TG was delayed. TG that was detained intracullularly was concentrated in the ER. Muresan and Arvan (1998) concluded that increased binding of BiP to TG leads to its delayed conformational maturation in the ER.

[11493]

[11494] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11495] Hendershot, L. M.; Valentine, V. A.; Lee, A. S.; Morris, S. W.; Shapiro, D. N. : Localization of the gene encoding human BiP/GRP78, the endoplasmic reticulum cognate of the HSP70 family, to chromosome 9q34. Genomics 20: 281-284, 1994. ; and

[11496] Muresan, Z.; Arvan, P. : Enhanced binding to the molecular chaperone BiP slows thyroglobulin export from the endoplasmic reticulum. Molec. Endocr. 12: 458- 467, 1998.

[11497] Further studies establishing the function and utilities of HSPA5 are found in John Hopkins OMIM database record ID 138120, and in cited publications listed in Table 5, which are hereby incorporated by reference.HSPC031 (Accession NM_016101.1) is another GAM72 target gene, herein designated TARGET GENE. HSPC031 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSPC031, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSPC031 BINDING SITE, designated SEQ ID:3773, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11498] Another function of GAM72 is therefore inhibition of

HSPC031 (Accession NM_016101.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC031.

[11499] HYPK (Accession NM_016400.2) is another GAM72 target gene, herein designated TARGET GENE. HYPK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HYPK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HYPK BINDING SITE, designated SEQ ID:17104, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11500] Another function of GAM72 is therefore inhibition of HYPK (Accession NM_016400.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYPK.

[11501] Interferon-related developmental regulator 1 (IFRD1, Accession NM_001550.1) is another GAM72 target gene, herein designated TARGET GENE. IFRD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IFRD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IFRD1 BINDING SITE, designated SEQ ID:6054, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11502] Another function of GAM72 is therefore inhibition of Interferon-related developmental regulator 1 (IFRD1, Accession NM_001550.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFRD1.

[11503] Interleukin 10 receptor, beta (IL10RB, Accession NM_000628.3) is another GAM72 target gene, herein designated TARGET GENE. IL10RB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL10RB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL10RB BINDING SITE, designated SEQ ID:8908, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11504] Another function of GAM72 is therefore inhibition of Interleukin 10 receptor, beta (IL10RB, Accession NM_000628.3) . Accordingly, utilities of GAM72 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with IL10RB.

[11505] Interleukin 11 (IL11, Accession NM_000641.2) is another GAM72 target gene, herein designated TARGET GENE. IL11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL11 BINDING SITE, designated SEQ ID:11693, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11506] Another function of GAM72 is therefore inhibition of Interleukin 11 (IL11, Accession NM_000641.2), a gene which stimulates the proliferation of hematopoietic stem cells and megakaryocyte progenitor cells and induces megakaryocyte maturation. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL11.

[11507] The function of IL11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM41.1.Interleukin 13 receptor, alpha 1 (IL13RA1,

Accession NM_001560.2) is another GAM72 target gene, herein designated TARGET GENE. IL13RA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL13RA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL13RA1 BINDING SITE, designated SEQ ID:1465, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11508] Another function of GAM72 is therefore inhibition of Interleukin 13 receptor, alpha 1 (IL13RA1, Accession NM_001560.2), a gene which binds il- 13 with a low affinity. together with il- 4r- alpha can form a functional receptor for il- 13 and therefore may be associated with Asthma and athopy. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Asthma and athopy, and of other diseases and clinical conditions associated with IL13RA1.

[11509] The function of IL13RA1 has been established by previous studies. Interleukin- 4 (IL4; 147780) and interleukin- 13 (IL13; 147683) are 2 cytokines that are secreted by activated T cells and have similar effects on monocytes and B

cells. Zurawski et al. (1993) demonstrated that the IL4 receptor (OMIM Ref. No. 147781) is a complex of at least 2 components. They described a mutant form of human IL4 that competitively antagonizes both human IL4 and human IL13. The amino acid sequences of IL4 and IL13 are approximately 30% homologous, and circular dichroism spectroscopy demonstrates that both proteins have a highly alpha- helical structure. IL13 competitively inhibited binding of IL4 to functional human IL4 receptors expressed on a cell line that responds to both IL4 and IL13. The binding of IL4 to an IL4- responsive cell line that does not respond to IL13, and the binding of IL4 to cloned IL4R ligand binding protein expressed on heterologous cells, were not inhibited by IL13. The results demonstrated that IL4 and IL13 share a receptor component that is important for signal transduction. Hilton et al. (1996) reviewed these and other data suggesting a model of IL4 and IL13 receptor composition and function Heinzmann et al. (2000) determined that a variant of human IL13 (OMIM Ref. No. 147683), arg110 to gln (OMIM Ref. No. A4464G), associated with asthma in case- control populations from Britain and Japan (peak odds ratio (OR) = 2.31, 95% confidence interval, 1.33 - 4.00); the variant also predicted asthma

and higher serum IL13 levels in a general, Japanese pediatric population. The authors referred to this variant as gln110 to arg. Immunohistochemistry demonstrated that both subunits of IL13R are prominently expressed in bronchial epithelium and smooth muscle from asthmatic subjects. Detailed molecular modeling analyses indicated that residue 110 of IL13 is important in the internal constitution of the ligand and crucial in ligand- receptor interaction. A noncoding variant of IL13R- alpha 1, 1398A-G, associated primarily with high IgE levels (OR = 3.38 in males, 1.10 in females) rather than asthma

[11510]

[11511] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11512] Hilton, D. J.; Zhang, J.- G.; Metcalf, D.; Alexander, W. S.; Nicola, N. A.; Willson, T. A. : Cloning and characterization of a binding subunit of the interleukin 13 receptor that is also a component of the interleukin 4 receptor. Proc. Nat. Acad. Sci. 93: 497- 501, 1996. ; and

[11513] Heinzmann, H.; Mao, X.- Q.; Akaiwa, M.; Kreomer, R. T.; Gao, P.- S.; Ohshima, K.; Umeshita, R.; Abe, Y.; Braun, S.; Yamashita, T.; Roberts, M. H.; Sugimoto, R.; and 20 others

: Genetic var.

[11514] Further studies establishing the function and utilities of IL13RA1 are found in John Hopkins OMIM database record ID 300119, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interleukin 18 (interferon-gamma-inducing factor) (IL18, Accession NM_001562.2) is another GAM72 target gene, herein designated TARGET GENE. IL18 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL18 BINDING SITE, designated SEQ ID:19198, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11515] Another function of GAM72 is therefore inhibition of Interleukin 18 (interferon-gamma-inducing factor) (IL18, Accession NM_001562.2), a gene which augments natural killer cell activity in spleen cells and stimulates interferon gamma production in t helper type i cells. and therefore may be associated with Crohn disease. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Crohn disease, and of other diseases and clinical

conditions associated with IL18.

[11516] The function of IL18 has been established by previous studies. Okamura et al. (1995) cloned an interferon-gamma (IFNG; 147570)- inducing factor that augments natural killer (NK) cell activity in spleen cells. The gene encodes a precursor protein of 192 amino acids and a mature protein of 157 amino acids. Messenger RNAs for the gene, designated IGIF by them, and for interleukin- 12 (IL12; OMIM Ref. No. 161560) were readily detected in Kupffer cells and activated macrophages. Recombinant IGIF induced IFNG more potently than did IL12, which is also a NK- cell stimulatory factor. Administration of anti-IGIF antibodies prevented liver damage in mice inoculated with Propionibacterium acnes and challenged with lipopolysaccharide that induces toxic shock. Okamura et al. (1995) speculated that IGIF may be involved in the development of Th1 cells and also in mechanisms of tissue injury in inflammatory reactions. The mechanism underlying the differentiation of CD4+ T cells into functionally distinct Th1 and Th2 subsets had been incompletely understood. The interferon- gamma- inducing factor is also known as interleukin- 18 (Sarvetnick, 1997). Rothe et al. (1997) concluded that IGIF expression is normally regu-

lated in autoimmune NOD mice and is closely associated with diabetes development. They showed that the Igif gene maps to mouse chromosome 9 within the Idd2 interval and is therefore a candidate for the Idd2 diabetes susceptibility gene, a non- MHC gene associated with the acceleration of diabetes development

[11517] Animal model experiments lend further support to the function of IL18. In transgenic mice, Konishi et al. (2002) showed that IL18 contributes to the spontaneous development of atopic dermatitis- like inflammatory skin lesions independently of IgE/Stat6 (OMIM Ref. No. 601512) under specific pathogen- free conditions. Overrelease of IL18 initiated atopic dermatitis- like inflammation, which was accelerated by interleukin 1- alpha (IL1A; 147760).

[11518] It is appreciated that the abovementioned animal model for IL18 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[11519] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11520] Okamura, H.; Tsutsui, H.; Komatsu, T.; Yutsudo, M.; Hakura, A.; Tanimoto, T.; Torigoe, K.; Okura, T.; Nukada,

Y.; Hattori, K.; Akita, K.; Namba, M.; Tanabe, F.; Konishi, K.; Fukuda, S.; Kurimoto, M. : Cloning of a new cytokine that induces IFN- gamma production by T cells. Nature 378: 88- 91, 1995. ; and

[11521] Konishi, H.; Tsutsui, H.; Murakami, T.; Yumikura- Futat- sugi, S.; Yamanaka, K.; Tanaka, M.; Iwakura, Y.; Suzuki, N.; Takeda, K.; Akira, S.; Nakanishi, K.; Mizutani, H. : IL- 18 contributes.

[11522] Further studies establishing the function and utilities of IL18 are found in John Hopkins OMIM database record ID 600953, and in cited publications listed in Table 5, which are hereby incorporated by reference.Intracisternal a par- ticle-promoted polypeptide (IPP, Accession NM_005897.1) is another GAM72 target gene, herein designated TARGET GENE. IPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IPP, cor- responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il- lustrates the complementarity of the nucleotide sequences of IPP BINDING SITE, designated SEQ ID:19290, to the nu- cleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11523] Another function of GAM72 is therefore inhibition of In-

tracisternal a particle-promoted polypeptide (IPP, Accession NM_005897.1), a gene which may play a role in organizing the actin cytoskeleton. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IPP.

[11524] The function of IPP has been established by previous studies. Chang- Yeh et al. (1991) cloned and characterized a novel cellular gene that is promoted by an intracisternal A- particle (IAP) LTR and expressed in the mouse placenta. They referred to it as mouse IAP- promoted placental gene (MIPP). From an 8- day- old mouse embryo cDNA library, they isolated a 1,067- bp cDNA clone containing an IAP LTR U5 region duplicated in its 5- prime terminus and an open reading frame coding for a potential 202- amino acid protein. Sequence of the 5- prime region of a genomic clone revealed the presence of a solo IAP LTR with the same U5 duplication, and primer extension analysis confirmed that transcription of the MIPP gene is under the control of the IAP LTR. Expression of the MIPP gene paralleled that of IAP genes in normal mouse tissues with abundant transcripts present in the placenta. By examining the expression of the MIPP gene in other tissues of the mid- gestation mouse conceptus by North-

ern analysis, Mold et al. (1991) found that expression is confined to tissues derived from 2 distinct cell lineages, the trophectoderm and primitive endoderm. The MIPP- encoded protein is composed of four 48- amino acid units and shares homology with a vaccinia virus gene product. MIPP- related sequences were also found in several mammals, including the human genome. If the same placental- specific pattern of expression is seen in humans, an examination of the human IPP promoter could lead to important insights into the role of retroviruses in evolution. By study of restriction fragment length variations (RFLV) in recombinant inbred (RI) mice, Chang- Yeh et al. (1993) mapped the Ipp gene to distal mouse chromosome 4. Chang- Yeh et al. (1993) mapped the human gene to 1p32- p22 by PCR analysis of DNAs from somatic cell hybrid panels.

[11525]

[11526] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11527] Chang- Yeh, A.; Jabs, E. W.; Li, X.; Dracopoli, N. C.; Huang, R. C. C. : The IPP gene is assigned to human chromosome 1p32- 1p22. Genomics 15: 239- 241, 1993. ; and

[11528] Chang- Yeh, A.; Mold, D. E.; Brilliant, M. H.; Huang, R. C. C. : The mouse intracisternal A particle- promoted placental gene retrotransposition is mouse- strain- specific. Proc. Nat. Acad.

[11529] Further studies establishing the function and utilities of IPP are found in John Hopkins OMIM database record ID 147485, and in cited publications listed in Table 5, which are hereby incorporated by reference.Interleukin-1 receptor-associated kinase 4 (IRAK4, Accession NM_016123.1) is another GAM72 target gene, herein designated TARGET GENE. IRAK4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IRAK4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IRAK4 BINDING SITE, designated SEQ ID:13012, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11530] Another function of GAM72 is therefore inhibition of Interleukin-1 receptor-associated kinase 4 (IRAK4, Accession NM_016123.1), a gene which may function as an IRAK1 kinase, triggering a cascade of phosphorylation events. and therefore may be associated with Renal tu-

mors. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Renal tumors, and of other diseases and clinical conditions associated with IRAK4.

[11531] The function of IRAK4 has been established by previous studies. By SEREX (serologic analysis of recombinant cDNA expression libraries) screening of renal tumors, Scanlan et al. (1999) identified multiple antigens, including REN64. The deduced 460- amino acid protein is strongly expressed in kidney, as determined by immunohistochemistry. RT- PCR analysis detected expression in all 6 tissues tested (lung, testis, small intestine, breast, liver, and placenta). By database searching for IRAK- like sequences and PCR of a universal cDNA library, Li et al. (2002) obtained a cDNA encoding IRAK4, which is 98% identical to REN64. The predicted protein is 84% identical to the mouse protein and, like IRAK1, IRAK2 (OMIM Ref. No. 603304), IRAKM (OMIM Ref. No. 604459), and the Drosophila Pelle protein, it has an N- terminal death domain and a central kinase domain. Unlike the other IRAK proteins, however, but similar to Pelle, IRAK4 has a short C- terminal domain. Northern blot analysis revealed expression of 3.0- and 4.4- kb transcripts, with strongest expression in kidney and liver. RT- PCR analysis detected

wide, low- level expression of IRAK4. Functional analysis by Li et al. (2002) determined that IRAK4, like IRAK1 and Pelle, has auto- and cross- phosphorylation kinase activity. Precipitation and binding analyses showed weak interaction between IRAK4 and IRAK1, but IRAK4 did not interact with other IRAK family members. Overexpressed IRAK4 interacted with MYD88 (OMIM Ref. No. 602170) and TRAF6 (OMIM Ref. No. 602355) and activated mitogen-activated protein kinase (MAPK) and nuclear factor kappa-B (NFKB; 164011) pathways. Endogenous IRAK4 associated in a transient IL1 (see OMIM Ref. No. 147720)- dependent manner with unmodified IRAK1 and TRAF6. Luciferase reporter analysis showed that IRAK4 lacking the kinase domain inhibited IL1- but not tumor necrosis factor (TNF; 191160)- induced NFKB and IRAK1 activation. SDS- PAGE and autoradiographic analysis indicated that IRAK4 phosphorylates and activates IRAK1 at thr387, but not vice versa. Li et al. (2002) proposed that IRAK4 acts upstream of other IRAKs and may function as an IRAK1 kinase, triggering a cascade of phosphorylation events By gene targeting, Suzuki et al. (2002) generated mice deficient in Irak4. Mutant mice and macrophages or embryonic fibroblasts (MEFs) from these mice were unable to respond

to Il1 by production of Il6 (OMIM Ref. No. 147620), Tnf, or nitric oxide, or by activation of Nfkb or Jnk (OMIM Ref. No. 601158). Responses to Tnf, however, were intact, suggesting that the defect was specific for Il1. Analysis of responses to lipopolysaccharide (LPS), bacterial DNA (unmethylated CpG), peptidoglycan, or viral RNA extended the importance of Irak4 to Tlr4, Tlr9 (OMIM Ref. No. 605474), Tlr2 (OMIM Ref. No. 603028), and Tlr3 (OMIM Ref. No. 603029), respectively, which use signaling mechanisms similar to IL1R. Challenge of Irak4 - /- mice with lymphocytic choriomeningitis virus showed reduced production of gamma- interferon (IFNG; 147570) by natural killer cells, but no loss of cytolytic function of these cells. Challenge with Staphylococcus aureus was lethal in all mutant mice but not in most wildtype mice. Luciferase reporter analysis suggested that Irak4 acts upstream of Myd88 and Mal (OMIM Ref. No. 606252) and downstream of Traf6.

[11532] Animal model experiments lend further support to the function of IRAK4. By gene targeting, Suzuki et al. (2002) generated mice deficient in Irak4. Mutant mice and macrophages or embryonic fibroblasts (MEFs) from these mice were unable to respond to Il1 by production of Il6

(OMIM Ref. No. 147620), Tnf, or nitric oxide, or by activation of Nfkb or Jnk (OMIM Ref. No. 601158). Responses to Tnf, however, were intact, suggesting that the defect was specific for Il1. Analysis of responses to lipopolysaccharide (LPS), bacterial DNA (unmethylated CpG), peptidoglycan, or viral RNA extended the importance of Irak4 to Tlr4, Tlr9 (OMIM Ref. No. 605474), Tlr2 (OMIM Ref. No. 603028), and Tlr3 (OMIM Ref. No. 603029), respectively, which use signaling mechanisms similar to IL1R. Challenge of Irak4 - /- mice with lymphocytic choriomeningitis virus showed reduced production of gamma- interferon (IFNG; 147570) by natural killer cells, but no loss of cytolytic function of these cells. Challenge with Staphylococcus aureus was lethal in all mutant mice but not in most wildtype mice. Luciferase reporter analysis suggested that Irak4 acts upstream of Myd88 and Mal (OMIM Ref. No. 606252) and downstream of Traf6

[11533] It is appreciated that the abovementioned animal model for IRAK4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[11534] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[11535] Li, S.; Strelow, A.; Fontana, E. J.; Wesche, H. : IRAK- 4: a novel member of the IRAK family with the properties of an IRAK- kinase. Proc. Nat. Acad. Sci. 99: 5567- 5572, 2002. ; and

[11536] Scanlan, M. J.; Gordon, J. D.; Williamson, B.; Stockert, E.; Bander, N. H.; Jongeneel, V.; Gure, A. O.; Jager, D.; Jager, E.; Knuth, A.; Chen, Y.- T.; Old, L. J. : Antigens recognized b.

[11537] Further studies establishing the function and utilities of IRAK4 are found in John Hopkins OMIM database record ID 606883, and in cited publications listed in Table 5, which are hereby incorporated by reference.Itchy homolog e3 ubiquitin protein ligase (mouse) (ITCH, Accession NM_031483.3) is another GAM72 target gene, herein designated TARGET GENE. ITCH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ITCH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITCH BINDING SITE, designated SEQ ID:13485, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11538] Another function of GAM72 is therefore inhibition of Itchy homolog e3 ubiquitin protein ligase (mouse) (ITCH, Accession NM_031483.3), a gene which accepts ubiquitin from an e2 ubiquitin- conjugating enzyme in the form of a thioester and then directly transfers the ubiquitin to targeted substrates. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITCH.

[11539] The function of ITCH has been established by previous studies. Using GST pull- down and coimmunoprecipitation experiments, Winberg et al. (2000) demonstrated that ITCH and KIAA0439 (OMIM Ref. No. 606384) form physiologic complexes with the Epstein- Barr virus (EBV) latent membrane protein 2a (LMP2A) in EBV- positive cells. They concluded that the ability of LMP2A to recognize the WW domains of ITCH or KIAA0439 is dependent on the LMP2A PPPPY motifs. Using chimeric protein analysis, they determined that the N- terminal region of LMP2A is necessary and sufficient for binding to ITCH and that this interaction is not dependent on tyrosine phosphorylation. The authors hypothesized that LMP2A promotes ITCH- mediated ubiquitination of Lyn (OMIM Ref. No. 165120) and Syk (OMIM Ref. No. 600085). With GST pull- down assays and

immunoprecipitation assays, Qiu et al. (2000) demonstrated that Itch binds to the N- terminal portion of the Notch (see OMIM Ref. No. 190198) intracellular domain via its WW domains and promotes ubiquitination of Notch through its HECT ubiquitin ligase domain. They hypothesized that Itch may participate in the regulation of immune responses by modifying Notch- mediated signaling. Using transfection experiments, Chen et al. (2001) concluded that ITCH can act as a transcriptional corepressor of p45/NFE2. The interaction between these 2 proteins is modulated through the WW1 domain of ITCH and requires the PY motif of p45/NFE2. In cotransfection assays, they observed that ITCH suppressed transcriptional activation by p45/NFE2. They hypothesized that the erythroid hyperplasia observed in a18H mice (see OMIM Ref. No. Animal Model section) is likely due to the loss of NFE2/ITCH interaction.

[11540] Animal model experiments lend further support to the function of ITCH. By analyzing genomic clones from wild-type and mutant mice, Perry et al. (1998) determined that the phenotype of the non- agouti- lethal 18H (a18H) or Itchy mice results from a small inversion that disrupts both the agouti and the Itch genes. The mice develop a

spectrum of immunologic diseases not seen in other mice with mutations in agouti. The phenotype includes inflammation of the lung and stomach, hyperplasia of lymphoid and hematopoietic cells, and constant itching in the skin, suggesting that Itch is involved in the regulation of immune response. The inversion in a18H mice appears to produce a null allele of Itch by removing the promoter from the coding region of the Itch gene. Perry et al. (1998) concluded that the a18H mutation provides a link between ubiquitin- dependent proteolysis and normal immune function in vivo in addition to identifying a molecule important for the regulation of epithelial and hematopoietic cell growth. D'Andrea and Serhan (1998) presented models of how the disruption of the Itch locus may cause the immune reaction seen in a18H mice and discussed the implications for possible functions of Itch

[11541] It is appreciated that the abovementioned animal model for ITCH is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[11542] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11543] Perry, W. L.; Hustad, C. M.; Swing, D. A.; O'Sullivan, T. N.; Jenkins, N. A.; Copeland, N. G. : The itchy locus encodes a novel ubiquitin protein ligase that is disrupted in a18H mice. Nature Genet. 18: 143- 146, 1998. ; and

[11544] Chen, X.; Wen, S.; Fukuda, M. N.; Gavva, N. R.; Hsu, D.; Akama, T. O.; Yang- Feng, T.; Shen, C. K. J. : Human ITCH is a coregulator of the hematopoietic transcription factor NF- E2. Genomi.

[11545] Further studies establishing the function and utilities of ITCH are found in John Hopkins OMIM database record ID 606409, and in cited publications listed in Table 5, which are hereby incorporated by reference.KBRAS2 (Accession NM_017595.2) is another GAM72 target gene, herein designated TARGET GENE. KBRAS2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KBRAS2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KBRAS2 BINDING SITE, designated SEQ ID:16138, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11546] Another function of GAM72 is therefore inhibition of

KBRAS2 (Accession NM_017595.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KBRAS2.

[11547] Potassium voltage-gated channel, shaker-related subfamily, member 7 (KCNA7, Accession NM_031886.2) is another GAM72 target gene, herein designated TARGET GENE. KCNA7 BINDING SITE1 and KCNA7 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KCNA7, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNA7 BINDING SITE1 and KCNA7 BINDING SITE2, designated SEQ ID:13270 and SEQ ID:15078 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11548] Another function of GAM72 is therefore inhibition of Potassium voltage-gated channel, shaker-related subfamily, member 7 (KCNA7, Accession NM_031886.2), a gene which allows nerve cells to efficiently repolarize following an action potential. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNA7.

[11549] The function of KCNA7 has been established by previous studies. See 176260 for a general discussion of potassium voltage- gated ion channels. Using a probe from the mouse in the study of somatic cell hybrids, McPherson et al. (1991) found that a seventh member of the Shaker- related potassium voltage- gated channel is encoded by a gene on chromosome 19. Kalman et al. (1998) reported the isolation of the mouse voltage- gated Shaker- related potassium channel gene, Kv1.7 (Kcna7). Unlike other known Kv1 family genes that have intronless coding regions, the protein- coding region of Kv1.7 was interrupted by a 1.9- kb intron. The gene was mapped to mouse chromosome 7 and human chromosome 19q13.3. The mouse Kv1.7 channel was voltage- dependent and exhibited cumulative inactivation. Northern blot analysis revealed transcripts of approximately 3 kb in mouse heart and skeletal muscle. Bardien- Kruger et al. (2002) deduced the coding region of KCNA7 by aligning the mouse cDNA sequence with a human BAC clone and mouse EST sequences. The region encodes a protein of 456 amino acid residues containing cytoplasmic N- and C- termini, a central core domain composed of 6 transmembrane segments and the characteristic pore- loop. The human in-

tron was 1153 bp in length and smaller than that of mouse (1929 bp). Using the deduced amino acid sequences, the potassium- channels of the 2 species were highly conserved (greater than 95%). The expression of KCNA7 in human adult heart was confirmed by RT- PCR studies. Bardien- Kruger et al. (2002) refined the location of the KCNA7 gene within chromosome 19q13.3 by bioinformatic in silico mapping and implicated it as a positional candidate gene for progressive familial heart block type I (OMIM Ref. No. 604559), an autosomal dominant cardiac conduction disorder mapped to 19q13.3. In affected individuals, Bardien- Kruger et al. (2002) screened the coding region of KCNA7 by PCR- SSCP analysis and direct DNA sequencing, which did not reveal any pathogenic sequence changes

[11550]

[11551] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11552] Bardien- Kruger, S.; Wulff, H.; Arieff, Z.; Brink, P.; Chandy, K. G.; Corfield, V. : Characterisation of the human voltage-gated potassium channel gene, KCNA7, a candidate gene for inherited cardiac disorders, and its exclusion as cause

of progressive familial heart block I (PFHBI). Europ. J. Hum. Genet. 10: 36- 43, 2002. ; and

[11553] Kalman, K.; Nguyen, A.; Tseng- Crank, J.; Dukes, I. D.; Chandy, G.; Hustad, C. M.; Copeland, N. G.; Jenkins, N. A.; Mohrenweiser, H.; Brandriff, B.; Cahalan, M.; Gutman, G. A.; Chandy, K.

[11554] Further studies establishing the function and utilities of KCNA7 are found in John Hopkins OMIM database record ID 176268, and in cited publications listed in Table 5, which are hereby incorporated by reference.Potassium inwardly-rectifying channel, subfamily j, member 5 (KCNJ5, Accession NM_000890.3) is another GAM72 target gene, herein designated TARGET GENE. KCNJ5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KCNJ5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNJ5 BINDING SITE, designated SEQ ID:12729, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11555] Another function of GAM72 is therefore inhibition of Potassium inwardly-rectifying channel, subfamily j, mem-

ber 5 (KCNJ5, Accession NM_000890.3), a gene which is a potassium inwardly- rectifying channel. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ5.

[11556] The function of KCNJ5 has been established by previous studies. Potassium channels inhibited by cytosolic ATP are found in a wide variety of tissues. Tucker et al. (1995) noted that in the pancreatic beta- cell, potassium channels play a critical role in the regulation of insulin secretion, and in smooth muscle they are responsible for hypoxic vasodilatation. Moreover, these channels are the targets for several important classes of therapeutic drugs, including the antidiabetic sulfonamides and the antihypertensive potassium channel openers. In the heart, as in other tissues, K(ATP) channels are thought to couple the membrane potential to the metabolic status of the cell, and these normally quiescent channels are activated during transient ischemic and hypoxic periods when they contribute to shortening of the cardiac action potential duration. Ashford et al. (1994) cloned the rat heart K(ATP) channel, thus enabling the isolation of the human homolog. The primary structure of KATP1 placed it in the J

subfamily of inwardly rectifying potassium channels (Bond et al., 1994), such as KCNJ2 (OMIM Ref. No. 600681) and KCNJ4 (OMIM Ref. No. 600504); thus, the human homolog was designated KCNJ5. Wickman et al. (1997) reported a partial sequence of human GIRK4. They used human/rodent somatic cell hybrids to localize the human gene to chromosome 11, consistent with previous studies that localized the gene to 11q23- ter. Wickman et al. (1997) cloned the mouse Girk4 gene. They showed that the gene is expressed almost exclusively in the mouse heart. Using interspecific backcross analysis, Wickman et al. (1997) mapped the mouse Girk4 gene to chromosome 9, consistent with the mapping to human chromosome 11.

[11557]

[11558] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11559] Ashford, M. L. J.; Bond, C. T.; Blair, T. A.; Adelman, J. P. : Cloning and functional expression of a rat heart KATP channel. Nature 370: 456- 459, 1994. ; and

[11560] Bond, C. T.; Pessia, M.; Xia, X.- M.; Lagrutta, A.; Kavanaugh, M. P.; Adelman, J. P. : Cloning and expression of a family of inward rectifier potassium channels. Receptors

Channels 2: 183.

[11561] Further studies establishing the function and utilities of KCNJ5 are found in John Hopkins OMIM database record ID 600734, and in cited publications listed in Table 5, which are hereby incorporated by reference.Potassium channel, subfamily k, member 6 (KCNK6, Accession NM_004823.1) is another GAM72 target gene, herein designated TARGET GENE. KCNK6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KCNK6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNK6 BINDING SITE, designated SEQ ID:4740, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11562] Another function of GAM72 is therefore inhibition of Potassium channel, subfamily k, member 6 (KCNK6, Accession NM_004823.1), a gene which is an inward rectifying potassium channel protein. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK6.

[11563] The function of KCNK6 has been established by previous studies. Potassium channels perform many distinct func-

tions in both excitable and nonexcitable cells. Members of the tandem pore domain potassium (K2P) channel family, such as TWIK1 (OMIM Ref. No. 601745) and TREK (OMIM Ref. No. 603219), contain 4 transmembrane domains and 2 pore- forming (P) domains. The K2P channels all produce quasi- instantaneous and noninactivating currents but exhibit different types of regulation, indicating that these potassium channels are probably involved in a great diversity of physiologic and pathophysiologic roles (Salinas et al., 1999). Both Chavez et al. (1999) and Pountney et al. (1999) identified cDNAs encoding human KCNK6, which they referred to as TWIK2 and TOSS (TWIK-originated similarity sequence), respectively. Chavez et al. (1999) reported that the predicted 313- amino acid TWIK2 protein shares 54% sequence similarity with TWIK1. Pountney et al. (1999) stated that since TOSS lacks a signal sequence, the N terminus is predicted to be intracellular. They noted that the P2 domain of TOSS contains an unusual GLG motif in a position corresponding to that found in TWIK1. While Chavez et al. (1999) found by Northern blot analysis that the 6.8-, 2.6-, and 1.35- kb TWIK2 mRNAs were expressed in many human tissues, Pountney et al. (1999) reported a more restricted expres-

sion pattern. In Xenopus oocytes expressing TWIK2, Chavez et al. (1999) detected noninactivating, weak inward rectification, while Pountney et al. (1999) failed to detect any currents above background. By radiation hybrid analysis, Gray et al. (1999) mapped the KCNK6 gene to chromosome 19q13.1.

[11564]

[11565] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11566] Chavez, R. A.; Gray, A. T.; Zhao, B. B.; Kindler, C. H.; Mazurek, M. J.; Mehta, Y.; Forsayeth, J. R.; Yost, C. S. : TWIK- 2, a new weak inward rectifying member of the tandem pore domain potassium channel family. J. Biol. Chem. 274: 7887- 7892, 1999. ; and

[11567] Gray, A. T.; Kindler, C. H.; Sampson, E. R.; Yost, C. S. : Assignment of KCNK6 encoding the human weak inward rectifier potassium channel TWIK- 2 to chromosome band 19q13.1 by radiation.

[11568] Further studies establishing the function and utilities of KCNK6 are found in John Hopkins OMIM database record ID 603939, and in cited publications listed in Table 5, which are hereby incorporated by reference.KIAA0057

(Accession) is another GAM72 target gene, herein designated TARGET GENE. KIAA0057 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0057, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0057 BINDING SITE, designated SEQ ID:8437, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11569] Another function of GAM72 is therefore inhibition of KIAA0057 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0057.

[11570] KIAA0090 (Accession NM_015047.1) is another GAM72 target gene, herein designated TARGET GENE. KIAA0090 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0090, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0090 BINDING SITE, designated SEQ ID:5892, to the nucleotide sequence of GAM72 RNA, herein designated

GAM RNA, also designated SEQ ID:342.

[11571] Another function of GAM72 is therefore inhibition of KIAA0090 (Accession NM_015047.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0090.

[11572] KIAA0391 (Accession NM_014672.1) is another GAM72 target gene, herein designated TARGET GENE. KIAA0391 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0391, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:19903, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11573] Another function of GAM72 is therefore inhibition of KIAA0391 (Accession NM_014672.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0391.

[11574] KIAA0419 (Accession NM_014711.1) is another GAM72 target gene, herein designated TARGET GENE. KIAA0419

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0419, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0419 BINDING SITE, designated SEQ ID:11980, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11575] Another function of GAM72 is therefore inhibition of KIAA0419 (Accession NM_014711.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0419.

[11576] KIAA0447 (Accession) is another GAM72 target gene, herein designated TARGET GENE. KIAA0447 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0447, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0447 BINDING SITE, designated SEQ ID:7417, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11577] Another function of GAM72 is therefore inhibition of KIAA0447 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0447.

[11578] KIAA0451 (Accession) is another GAM72 target gene, herein designated TARGET GENE. KIAA0451 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0451, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0451 BINDING SITE, designated SEQ ID:3255, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11579] Another function of GAM72 is therefore inhibition of KIAA0451 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0451.

[11580] KIAA0475 (Accession XM_301133.1) is another GAM72 target gene, herein designated TARGET GENE. KIAA0475 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:587, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11581] Another function of GAM72 is therefore inhibition of KIAA0475 (Accession XM_301133.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475.

[11582] KIAA0547 (Accession) is another GAM72 target gene, herein designated TARGET GENE. KIAA0547 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0547, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0547 BINDING SITE, designated SEQ ID:1327, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11583] Another function of GAM72 is therefore inhibition of KIAA0547 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with KIAA0547.

[11584] KIAA0565 (Accession XM_039912.4) is another GAM72 target gene, herein designated TARGET GENE. KIAA0565 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0565, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0565 BINDING SITE, designated SEQ ID:16513, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11585] Another function of GAM72 is therefore inhibition of KIAA0565 (Accession XM_039912.4) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0565.

[11586] KIAA0596 (Accession) is another GAM72 target gene, herein designated TARGET GENE. KIAA0596 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0596, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0596

BINDING SITE, designated SEQ ID:19199, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11587] Another function of GAM72 is therefore inhibition of KIAA0596 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0596.

[11588] KIAA0628 (Accession NM_014789.1) is another GAM72 target gene, herein designated TARGET GENE. KIAA0628 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0628, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0628 BINDING SITE, designated SEQ ID:8071, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11589] Another function of GAM72 is therefore inhibition of KIAA0628 (Accession NM_014789.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0628.

[11590] KIAA0694 (Accession XM_051970.3) is another GAM72

target gene, herein designated TARGET GENE. KIAA0694 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0694, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0694 BINDING SITE, designated SEQ ID:13722, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11591] Another function of GAM72 is therefore inhibition of KIAA0694 (Accession XM_051970.3) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0694.

[11592] KIAA0831 (Accession NM_014924.1) is another GAM72 target gene, herein designated TARGET GENE. KIAA0831 BINDING SITE1 and KIAA0831 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA0831, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0831 BINDING SITE1 and KIAA0831 BINDING SITE2, designated SEQ ID:19089 and

SEQ ID:6562 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11593] Another function of GAM72 is therefore inhibition of KIAA0831 (Accession NM_014924.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0831.

[11594] KIAA0884 (Accession XM_046660.4) is another GAM72 target gene, herein designated TARGET GENE. KIAA0884 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA0884, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0884 BINDING SITE, designated SEQ ID:7518, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11595] Another function of GAM72 is therefore inhibition of KIAA0884 (Accession XM_046660.4) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0884.

[11596] KIAA0889 (Accession NM_152257.1) is another GAM72 target gene, herein designated TARGET GENE. KIAA0889 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA0889, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0889 BINDING SITE, designated SEQ ID:17820, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11597] Another function of GAM72 is therefore inhibition of KIAA0889 (Accession NM_152257.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0889.

[11598] KIAA0953 (Accession XM_039733.2) is another GAM72 target gene, herein designated TARGET GENE. KIAA0953 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0953, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0953 BINDING SITE, designated SEQ ID:7972, to the

nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11599] Another function of GAM72 is therefore inhibition of KIAA0953 (Accession XM_039733.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0953.

[11600] KIAA0981 (Accession XM_028867.2) is another GAM72 target gene, herein designated TARGET GENE. KIAA0981 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0981, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0981 BINDING SITE, designated SEQ ID:18398, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11601] Another function of GAM72 is therefore inhibition of KIAA0981 (Accession XM_028867.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0981.

[11602] KIAA1001 (Accession NM_014960.1) is another GAM72

target gene, herein designated TARGET GENE. KIAA1001 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1001, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1001 BINDING SITE, designated SEQ ID:3031, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11603] Another function of GAM72 is therefore inhibition of KIAA1001 (Accession NM_014960.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1001.

[11604] KIAA1086 (Accession XM_047610.1) is another GAM72 target gene, herein designated TARGET GENE. KIAA1086 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1086, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1086 BINDING SITE, designated SEQ ID:10445, to the nucleotide sequence of GAM72 RNA, herein designated

GAM RNA, also designated SEQ ID:342.

[11605] Another function of GAM72 is therefore inhibition of KIAA1086 (Accession XM_047610.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1086.

[11606] KIAA1143 (Accession XM_044014.3) is another GAM72 target gene, herein designated TARGET GENE. KIAA1143 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1143, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1143 BINDING SITE, designated SEQ ID:3668, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11607] Another function of GAM72 is therefore inhibition of KIAA1143 (Accession XM_044014.3) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1143.

[11608] KIAA1164 (Accession XM_045358.2) is another GAM72 target gene, herein designated TARGET GENE. KIAA1164

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1164, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1164 BINDING SITE, designated SEQ ID:16893, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11609] Another function of GAM72 is therefore inhibition of KIAA1164 (Accession XM_045358.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1164.

[11610] KIAA1202 (Accession XM_050478.2) is another GAM72 target gene, herein designated TARGET GENE. KIAA1202 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1202, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1202 BINDING SITE, designated SEQ ID:1103, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11611] Another function of GAM72 is therefore inhibition of KIAA1202 (Accession XM_050478.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1202.

[11612] KIAA1204 (Accession) is another GAM72 target gene, herein designated TARGET GENE. KIAA1204 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1204, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1204 BINDING SITE, designated SEQ ID:19727, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11613] Another function of GAM72 is therefore inhibition of KIAA1204 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1204.

[11614] KIAA1253 (Accession) is another GAM72 target gene, herein designated TARGET GENE. KIAA1253 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1253, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1253 BINDING SITE, designated SEQ ID:16508, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11615] Another function of GAM72 is therefore inhibition of KIAA1253 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1253.

[11616] KIAA1257 (Accession XM_031577.3) is another GAM72 target gene, herein designated TARGET GENE. KIAA1257 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1257, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:8495, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11617] Another function of GAM72 is therefore inhibition of KIAA1257 (Accession XM_031577.3) . Accordingly, utilities of GAM72 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1257.

[11618] KIAA1276 (Accession XM_039169.1) is another GAM72 target gene, herein designated TARGET GENE. KIAA1276 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1276, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1276 BINDING SITE, designated SEQ ID:13081, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11619] Another function of GAM72 is therefore inhibition of KIAA1276 (Accession XM_039169.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1276.

[11620] KIAA1348 (Accession XM_043826.5) is another GAM72 target gene, herein designated TARGET GENE. KIAA1348 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1348, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA1348 BINDING SITE, designated SEQ ID:8164, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11621] Another function of GAM72 is therefore inhibition of KIAA1348 (Accession XM_043826.5) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1348.

[11622] KIAA1423 (Accession XM_029703.1) is another GAM72 target gene, herein designated TARGET GENE. KIAA1423 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1423, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1423 BINDING SITE, designated SEQ ID:2123, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11623] Another function of GAM72 is therefore inhibition of KIAA1423 (Accession XM_029703.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1423.

[11624] KIAA1456 (Accession XM_040100.4) is another GAM72 target gene, herein designated TARGET GENE. KIAA1456 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1456, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1456 BINDING SITE, designated SEQ ID:767, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11625] Another function of GAM72 is therefore inhibition of KIAA1456 (Accession XM_040100.4) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1456.

[11626] KIAA1486 (Accession XM_041126.5) is another GAM72 target gene, herein designated TARGET GENE. KIAA1486 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1486, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

KIAA1486 BINDING SITE, designated SEQ ID:1131, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11627] Another function of GAM72 is therefore inhibition of KIAA1486 (Accession XM_041126.5) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1486.

[11628] KIAA1508 (Accession XM_290952.1) is another GAM72 target gene, herein designated TARGET GENE. KIAA1508 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1508, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1508 BINDING SITE, designated SEQ ID:6930, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11629] Another function of GAM72 is therefore inhibition of KIAA1508 (Accession XM_290952.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1508.

[11630] KIAA1614 (Accession XM_046531.1) is another GAM72 target gene, herein designated TARGET GENE. KIAA1614 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1614, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1614 BINDING SITE, designated SEQ ID:18444, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11631] Another function of GAM72 is therefore inhibition of KIAA1614 (Accession XM_046531.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1614.

[11632] KIAA1641 (Accession XM_087167.3) is another GAM72 target gene, herein designated TARGET GENE. KIAA1641 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KIAA1641, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1641 BINDING SITE, designated

SEQ ID:1772, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11633] Another function of GAM72 is therefore inhibition of KIAA1641 (Accession XM_087167.3) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1641.

[11634] KIAA1649 (Accession) is another GAM72 target gene, herein designated TARGET GENE. KIAA1649 BINDING SITE1 and KIAA1649 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by KIAA1649, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1649 BINDING SITE1 and KIAA1649 BINDING SITE2, designated SEQ ID:6163 and SEQ ID:12470 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11635] Another function of GAM72 is therefore inhibition of KIAA1649 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649.

[11636] KIAA1715 (Accession XM_042834.2) is another GAM72 target gene, herein designated TARGET GENE. KIAA1715 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1715, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1715 BINDING SITE, designated SEQ ID:11201, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11637] Another function of GAM72 is therefore inhibition of KIAA1715 (Accession XM_042834.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1715.

[11638] KIAA1727 (Accession XM_034262.6) is another GAM72 target gene, herein designated TARGET GENE. KIAA1727 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1727, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:17480, to the

nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11639] Another function of GAM72 is therefore inhibition of KIAA1727 (Accession XM_034262.6) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1727.

[11640] KIAA1821 (Accession) is another GAM72 target gene, herein designated TARGET GENE. KIAA1821 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1821, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1821 BINDING SITE, designated SEQ ID:13832, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11641] Another function of GAM72 is therefore inhibition of KIAA1821 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1821.

[11642] KIAA1829 (Accession XM_030378.2) is another GAM72 target gene, herein designated TARGET GENE. KIAA1829

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1829, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1829 BINDING SITE, designated SEQ ID:1448, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11643] Another function of GAM72 is therefore inhibition of KIAA1829 (Accession XM_030378.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1829.

[11644] KIAA1841 (Accession XM_087056.4) is another GAM72 target gene, herein designated TARGET GENE. KIAA1841 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1841, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1841 BINDING SITE, designated SEQ ID:17999, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11645] Another function of GAM72 is therefore inhibition of KIAA1841 (Accession XM_087056.4) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1841.

[11646] KIAA1871 (Accession XM_290737.1) is another GAM72 target gene, herein designated TARGET GENE. KIAA1871 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1871, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1871 BINDING SITE, designated SEQ ID:3023, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11647] Another function of GAM72 is therefore inhibition of KIAA1871 (Accession XM_290737.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1871.

[11648] KIAA1872 (Accession NM_033064.1) is another GAM72 target gene, herein designated TARGET GENE. KIAA1872 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1872, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1872 BINDING SITE, designated SEQ ID:19477, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11649] Another function of GAM72 is therefore inhibition of KIAA1872 (Accession NM_033064.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1872.

[11650] KIAA1948 (Accession) is another GAM72 target gene, herein designated TARGET GENE. KIAA1948 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1948, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1948 BINDING SITE, designated SEQ ID:10715, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11651] Another function of GAM72 is therefore inhibition of

KIAA1948 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1948.

[11652] Kinesin family member 1b (KIF1B, Accession NM_015074.1) is another GAM72 target gene, herein designated TARGET GENE. KIF1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIF1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIF1B BINDING SITE, designated SEQ ID:17155, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11653] Another function of GAM72 is therefore inhibition of Kinesin family member 1b (KIF1B, Accession NM_015074.1), a gene which motor for anterograde transport of mitochondria. has a microtubule plus end- directed motility. and therefore is associated with Charcot- marie- tooth disease, neuronal type, a. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Charcot-marie- tooth disease, neuronal type, a, and of other diseases and clinical conditions associated with KIF1B.

[11654] The function of KIF1B has been established by previous

studies. Nangaku et al. (1994) cloned a member of the mouse kinesin superfamily, Kif1b, which encodes an N-terminal- type motor protein. Kif1b was expressed in all tissues tested. In situ hybridization revealed that Kif1b is expressed abundantly in differentiated nerve cells. The authors found that Kif1b works as a monomer, having a microtubule plus- end- directed motility. Rotary shadowing electron microscopy revealed mostly single globular structures. Immunocytochemically, Kif1b was colocalized with mitochondria in vivo. A subcellular fractionation study showed that Kif1b is concentrated in the mitochondrial fraction, and purified Kif1b could transport mitochondria along microtubules in vitro. These data suggested that Kif1b works as a monomeric motor for anterograde transport of mitochondria. Zhao et al. (2001) identified an isoform of mouse Kif1b, which they called Kif1b- beta, that is distinct from Kif1b- alpha (Nangaku et al., 1994) in its cargo- binding domain. Yang et al. (2001) identified the KIF1B gene in a homozygously deleted region of chromosome 1p36.2 in a neuroblastoma cell line. They reported results suggesting that the gene is not a candidate for tumor suppressor gene of neuroblastoma. Northern blot analysis demonstrated that human KIF1B

has at least 2 isoforms. The long isoform (KIF1B- beta) was expressed in a wide variety of tissues, while the short isoform (KIF1B- alpha) was detected only in adult testis.

[11655]

[11656] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11657] Yang, H. W.; Chen, Y. Z.; Takita, J.; Soeda, E.; Piao, H. Y.; Hayashi, Y. : Genomic structure and mutational analysis of the human KIF1B gene which is homozygously deleted in neuroblastoma at chromosome 1p36.2. Oncogene 20: 5075- 5083, 2001. ; and

[11658] Nangaku, M.; Sato- Yoshitake, R.; Okada, Y.; Noda, Y.; Takemura, R.; Yamazaki, H.; Hirokawa, N. : KIF1B, a novel microtubule plus end- directed monomeric motor protein for transport of mi.

[11659] Further studies establishing the function and utilities of KIF1B are found in John Hopkins OMIM database record ID 605995, and in cited publications listed in Table 5, which are hereby incorporated by reference.Kinesin family mem- ber 3b (KIF3B, Accession NM_004798.1) is another GAM72 target gene, herein designated TARGET GENE. KIF3B BIND- ING SITE is a target binding site found in the 3` untrans-

lated region of mRNA encoded by KIF3B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIF3B BINDING SITE, designated SEQ ID:406, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11660] Another function of GAM72 is therefore inhibition of Kinesin family member 3b (KIF3B, Accession NM_004798.1), a gene which is a microtubule- based anterograde translocator for membranous organelles. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF3B.

[11661] The function of KIF3B has been established by previous studies. In eukaryotic cells, proteins and lipids are sorted and transported to their correct destinations at distinct velocities by each organelle or protein complex. Kinesin superfamily proteins are a molecular motor superfamily involved in these processes, conveying their own cargoes along microtubules. Nagase et al. (1997) cloned the KIF3B gene, which they referred to as KIAA0359, the human homolog of the mouse kinase superfamily 3B gene

(Yamazaki et al., 1995). The human KIF3B gene encodes a 747- amino acid protein that shares 98% identity with the mouse Kif3b protein. RT- PCR analysis revealed that the KIF3B gene was ubiquitously expressed in all human tissues tested. By analysis of radiation hybrid panels, Nagase et al. (1997) mapped the KIF3B gene to chromosome 20

[11662] Animal model experiments lend further support to the function of KIF3B. By gene targeting, Nonaka et al. (1998) disrupted the murine Kif3b gene. The null mutants did not survive beyond midgestation, exhibiting growth retardation, pericardial sac ballooning, and neural tube disorganization. Prominently, the left- right asymmetry was randomized in the heart loop and the direction of embryonic turning. Lefty- 2 (OMIM Ref. No. 603037) expression was either bilateral or absent. Furthermore, the node lacked monocilia while the basal bodies were present. Immunocytochemistry revealed Kif3b localization in wildtype nodal cilia. Video microscopy showed that these cilia were motile and generated a leftward flow. These data suggested that KIF3B is essential for the left- right determination through intraciliary transportation of materials for ciliogenesis of motile primary cilia that could produce a gradient of putative morphogen along the left- right axis

in the node

[11663] It is appreciated that the abovementioned animal model for KIF3B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[11664] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[11665] Nagase, T.; Ishikawa, K.; Nakajima, D.; Ohira, M.; Seki, N.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. VII. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 4: 141- 150, 1997. ; and

[11666] Nonaka, S.; Tanaka, Y.; Okada, Y.; Takeda, S.; Harada, A.; Kanai, Y.; Kido, M.; Hirokawa, N. : Randomization of left-right asymmetry due to loss of nodal cilia generating leftward flow.

[11667] Further studies establishing the function and utilities of KIF3B are found in John Hopkins OMIM database record ID 603754, and in cited publications listed in Table 5, which are hereby incorporated by reference.Kelch-like 6 (drosophila) (KLHL6, Accession NM_130446.1) is another

GAM72 target gene, herein designated TARGET GENE. KLHL6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KLHL6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLHL6 BINDING SITE, designated SEQ ID:7713, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11668] Another function of GAM72 is therefore inhibition of Kelch-like 6 (drosophila) (KLHL6, Accession NM_130446.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL6.

[11669] KR18 (Accession NM_033288.1) is another GAM72 target gene, herein designated TARGET GENE. KR18 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KR18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KR18 BINDING SITE, designated SEQ ID:11484, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also

designated SEQ ID:342.

[11670] Another function of GAM72 is therefore inhibition of KR18 (Accession NM_033288.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KR18.

[11671] LOC113523 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC113523 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC113523, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC113523 BINDING SITE, designated SEQ ID:11541, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11672] Another function of GAM72 is therefore inhibition of LOC113523 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113523.

[11673] LOC115129 (Accession XM_055292.1) is another GAM72 target gene, herein designated TARGET GENE. LOC115129 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC115129, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC115129 BINDING SITE, designated SEQ ID:16505, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11674] Another function of GAM72 is therefore inhibition of LOC115129 (Accession XM_055292.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115129.

[11675] LOC115196 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC115196 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC115196, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC115196 BINDING SITE, designated SEQ ID:16754, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11676] Another function of GAM72 is therefore inhibition of LOC115196 (Accession) . Accordingly, utilities of GAM72

include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115196.

[11677] LOC115273 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC115273 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC115273, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC115273 BINDING SITE, designated SEQ ID:8356, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11678] Another function of GAM72 is therefore inhibition of LOC115273 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115273.

[11679] LOC115757 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC115757 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC115757, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC115757 BINDING SITE, designated SEQ ID:3024, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11680] Another function of GAM72 is therefore inhibition of LOC115757 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115757.

[11681] LOC115861 (Accession NM_138454.1) is another GAM72 target gene, herein designated TARGET GENE. LOC115861 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC115861, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC115861 BINDING SITE, designated SEQ ID:8383, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11682] Another function of GAM72 is therefore inhibition of LOC115861 (Accession NM_138454.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115861.

[11683] LOC116143 (Accession NM_138458.1) is another GAM72

target gene, herein designated TARGET GENE. LOC116143 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC116143, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC116143 BINDING SITE, designated SEQ ID:8282, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11684] Another function of GAM72 is therefore inhibition of LOC116143 (Accession NM_138458.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116143.

[11685] LOC116236 (Accession XM_057674.5) is another GAM72 target gene, herein designated TARGET GENE. LOC116236 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC116236, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC116236 BINDING SITE, designated SEQ ID:10907, to the nucleotide sequence of GAM72 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:342.

[11686] Another function of GAM72 is therefore inhibition of LOC116236 (Accession XM_057674.5) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116236.

[11687] LOC118471 (Accession NM_145202.1) is another GAM72 target gene, herein designated TARGET GENE. LOC118471 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC118471, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC118471 BINDING SITE, designated SEQ ID:14292, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11688] Another function of GAM72 is therefore inhibition of LOC118471 (Accession NM_145202.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118471.

[11689] LOC122970 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC122970 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC122970, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC122970 BINDING SITE, designated SEQ ID:17020, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11690] Another function of GAM72 is therefore inhibition of LOC122970 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122970.

[11691] LOC126282 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC126282 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126282, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126282 BINDING SITE, designated SEQ ID:18753, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11692] Another function of GAM72 is therefore inhibition of

LOC126282 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126282.

[11693] LOC126432 (Accession XM_059046.7) is another GAM72 target gene, herein designated TARGET GENE. LOC126432 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126432, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126432 BINDING SITE, designated SEQ ID:3331, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11694] Another function of GAM72 is therefore inhibition of LOC126432 (Accession XM_059046.7) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126432.

[11695] LOC127262 (Accession XM_072073.6) is another GAM72 target gene, herein designated TARGET GENE. LOC127262 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC127262, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC127262 BINDING SITE, designated SEQ ID:13265, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11696] Another function of GAM72 is therefore inhibition of LOC127262 (Accession XM_072073.6) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127262.

[11697] LOC127294 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC127294 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC127294, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC127294 BINDING SITE, designated SEQ ID:14191, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11698] Another function of GAM72 is therefore inhibition of LOC127294 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with LOC127294.

[11699] LOC127428 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC127428 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC127428, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC127428 BINDING SITE, designated SEQ ID:14475, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11700] Another function of GAM72 is therefore inhibition of LOC127428 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127428.

[11701] LOC130535 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC130535 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC130535, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130535 BINDING SITE, designated SEQ ID:6355, to the

nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11702] Another function of GAM72 is therefore inhibition of LOC130535 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130535.

[11703] LOC131965 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC131965 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC131965, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC131965 BINDING SITE, designated SEQ ID:3563, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11704] Another function of GAM72 is therefore inhibition of LOC131965 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131965.

[11705] LOC132625 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC132625 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by LOC132625, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC132625 BINDING SITE, designated SEQ ID:8924, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11706] Another function of GAM72 is therefore inhibition of LOC132625 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132625.

[11707] LOC133926 (Accession XM_059674.5) is another GAM72 target gene, herein designated TARGET GENE. LOC133926 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC133926, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC133926 BINDING SITE, designated SEQ ID:6976, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11708] Another function of GAM72 is therefore inhibition of LOC133926 (Accession XM_059674.5) . Accordingly, utili-

ties of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133926.

[11709] LOC138389 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC138389 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC138389, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC138389 BINDING SITE, designated SEQ ID:11357, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11710] Another function of GAM72 is therefore inhibition of LOC138389 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138389.

[11711] LOC139422 (Accession XM_066687.3) is another GAM72 target gene, herein designated TARGET GENE. LOC139422 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC139422, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC139422 BINDING SITE, designated SEQ ID:19244, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11712] Another function of GAM72 is therefore inhibition of LOC139422 (Accession XM_066687.3) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139422.

[11713] LOC142948 (Accession XM_096364.1) is another GAM72 target gene, herein designated TARGET GENE. LOC142948 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC142948, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC142948 BINDING SITE, designated SEQ ID:8177, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11714] Another function of GAM72 is therefore inhibition of LOC142948 (Accession XM_096364.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC142948.

[11715] LOC144465 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC144465 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144465, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144465 BINDING SITE, designated SEQ ID:16349, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11716] Another function of GAM72 is therefore inhibition of LOC144465 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144465.

[11717] LOC144524 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC144524 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144524, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144524 BINDING SITE, designated SEQ ID:20141, to

the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11718] Another function of GAM72 is therefore inhibition of LOC144524 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144524.

[11719] LOC145387 (Accession XM_096791.1) is another GAM72 target gene, herein designated TARGET GENE. LOC145387 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145387, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145387 BINDING SITE, designated SEQ ID:11469, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11720] Another function of GAM72 is therefore inhibition of LOC145387 (Accession XM_096791.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145387.

[11721] LOC145988 (Accession XM_085290.7) is another GAM72 target gene, herein designated TARGET GENE. LOC145988

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC145988, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145988 BINDING SITE, designated SEQ ID:7470, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11722] Another function of GAM72 is therefore inhibition of LOC145988 (Accession XM_085290.7) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145988.

[11723] LOC146159 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC146159 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146159, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146159 BINDING SITE, designated SEQ ID:3209, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11724] Another function of GAM72 is therefore inhibition of LOC146159 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146159.

[11725] LOC146540 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC146540 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146540, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146540 BINDING SITE, designated SEQ ID:16974, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11726] Another function of GAM72 is therefore inhibition of LOC146540 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146540.

[11727] LOC146656 (Accession XM_085536.1) is another GAM72 target gene, herein designated TARGET GENE. LOC146656 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146656, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146656 BINDING SITE, designated SEQ ID:4213, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11728] Another function of GAM72 is therefore inhibition of LOC146656 (Accession XM_085536.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146656.

[11729] LOC146669 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC146669 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146669, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146669 BINDING SITE, designated SEQ ID:8777, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11730] Another function of GAM72 is therefore inhibition of LOC146669 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with LOC146669.

[11731] LOC146728 (Accession XM_097074.1) is another GAM72 target gene, herein designated TARGET GENE. LOC146728 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146728, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146728 BINDING SITE, designated SEQ ID:3515, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11732] Another function of GAM72 is therefore inhibition of LOC146728 (Accession XM_097074.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146728.

[11733] LOC146780 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC146780 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146780, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC146780 BINDING SITE, designated SEQ ID:10771, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11734] Another function of GAM72 is therefore inhibition of LOC146780 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146780.

[11735] LOC146901 (Accession XM_097121.1) is another GAM72 target gene, herein designated TARGET GENE. LOC146901 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146901, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146901 BINDING SITE, designated SEQ ID:18219, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11736] Another function of GAM72 is therefore inhibition of LOC146901 (Accession XM_097121.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146901.

[11737] LOC146958 (Accession XM_097142.1) is another GAM72

target gene, herein designated TARGET GENE. LOC146958 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146958, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146958 BINDING SITE, designated SEQ ID:8050, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11738] Another function of GAM72 is therefore inhibition of LOC146958 (Accession XM_097142.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146958.

[11739] LOC146975 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC146975 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146975, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146975 BINDING SITE, designated SEQ ID:8141, to the nucleotide sequence of GAM72 RNA, herein designated

GAM RNA, also designated SEQ ID:342.

[11740] Another function of GAM72 is therefore inhibition of LOC146975 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146975.

[11741] LOC147080 (Accession XM_097182.1) is another GAM72 target gene, herein designated TARGET GENE. LOC147080 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC147080, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147080 BINDING SITE, designated SEQ ID:4511, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11742] Another function of GAM72 is therefore inhibition of LOC147080 (Accession XM_097182.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147080.

[11743] LOC147669 (Accession XM_097262.1) is another GAM72 target gene, herein designated TARGET GENE. LOC147669 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC147669, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147669 BINDING SITE, designated SEQ ID:2584, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11744] Another function of GAM72 is therefore inhibition of LOC147669 (Accession XM_097262.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147669.

[11745] LOC147727 (Accession XM_085862.6) is another GAM72 target gene, herein designated TARGET GENE. LOC147727 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC147727, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147727 BINDING SITE, designated SEQ ID:18394, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11746] Another function of GAM72 is therefore inhibition of

LOC147727 (Accession XM_085862.6) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147727.

[11747] LOC148267 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC148267 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148267, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148267 BINDING SITE, designated SEQ ID:17321, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11748] Another function of GAM72 is therefore inhibition of LOC148267 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148267.

[11749] LOC148293 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC148293 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148293, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148293 BINDING SITE, designated SEQ ID:15074, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11750] Another function of GAM72 is therefore inhibition of LOC148293 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148293.

[11751] LOC148343 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC148343 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148343, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148343 BINDING SITE, designated SEQ ID:5999, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11752] Another function of GAM72 is therefore inhibition of LOC148343 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148343.

[11753] LOC148397 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC148397 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148397, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148397 BINDING SITE, designated SEQ ID:7273, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11754] Another function of GAM72 is therefore inhibition of LOC148397 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148397.

[11755] LOC148918 (Accession XM_086361.5) is another GAM72 target gene, herein designated TARGET GENE. LOC148918 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148918, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148918 BINDING SITE, designated SEQ ID:18844, to the nucleotide sequence of GAM72 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:342.

[11756] Another function of GAM72 is therefore inhibition of LOC148918 (Accession XM_086361.5) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148918.

[11757] LOC149464 (Accession XM_097645.4) is another GAM72 target gene, herein designated TARGET GENE. LOC149464 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC149464, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149464 BINDING SITE, designated SEQ ID:4860, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11758] Another function of GAM72 is therefore inhibition of LOC149464 (Accession XM_097645.4) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149464.

[11759] LOC149711 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC149711 BINDING

SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149711, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149711 BINDING SITE, designated SEQ ID:19797, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11760] Another function of GAM72 is therefore inhibition of LOC149711 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149711.

[11761] LOC150139 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC150139 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150139, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150139 BINDING SITE, designated SEQ ID:6506, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11762] Another function of GAM72 is therefore inhibition of

LOC150139 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150139.

[11763] LOC150142 (Accession XM_086791.3) is another GAM72 target gene, herein designated TARGET GENE. LOC150142 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150142 BINDING SITE, designated SEQ ID:9701, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11764] Another function of GAM72 is therefore inhibition of LOC150142 (Accession XM_086791.3) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150142.

[11765] LOC150225 (Accession XM_097870.1) is another GAM72 target gene, herein designated TARGET GENE. LOC150225 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150225, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:16037, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11766] Another function of GAM72 is therefore inhibition of LOC150225 (Accession XM_097870.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225.

[11767] LOC150245 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC150245 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150245, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150245 BINDING SITE, designated SEQ ID:7735, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11768] Another function of GAM72 is therefore inhibition of LOC150245 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with LOC150245.

[11769] LOC150299 (Accession XM_097869.2) is another GAM72 target gene, herein designated TARGET GENE. LOC150299 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150299, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150299 BINDING SITE, designated SEQ ID:20103, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11770] Another function of GAM72 is therefore inhibition of LOC150299 (Accession XM_097869.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150299.

[11771] LOC150630 (Accession XM_097931.1) is another GAM72 target gene, herein designated TARGET GENE. LOC150630 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC150630, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC150630 BINDING SITE, designated SEQ ID:7681, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11772] Another function of GAM72 is therefore inhibition of LOC150630 (Accession XM_097931.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150630.

[11773] LOC150960 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC150960 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150960, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150960 BINDING SITE, designated SEQ ID:7643, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11774] Another function of GAM72 is therefore inhibition of LOC150960 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150960.

[11775] LOC150998 (Accession) is another GAM72 target gene,

herein designated TARGET GENE. LOC150998 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150998, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150998 BINDING SITE, designated SEQ ID:14192, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11776] Another function of GAM72 is therefore inhibition of LOC150998 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150998.

[11777] LOC151248 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC151248 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151248, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151248 BINDING SITE, designated SEQ ID:3564, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11778] Another function of GAM72 is therefore inhibition of LOC151248 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151248.

[11779] LOC151429 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC151429 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151429, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151429 BINDING SITE, designated SEQ ID:17658, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11780] Another function of GAM72 is therefore inhibition of LOC151429 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151429.

[11781] LOC151438 (Accession XM_098060.1) is another GAM72 target gene, herein designated TARGET GENE. LOC151438 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151438, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151438 BINDING SITE, designated SEQ ID:729, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11782] Another function of GAM72 is therefore inhibition of LOC151438 (Accession XM_098060.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151438.

[11783] LOC152002 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC152002 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152002, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152002 BINDING SITE, designated SEQ ID:5871, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11784] Another function of GAM72 is therefore inhibition of LOC152002 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with LOC152002.

[11785] LOC152106 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC152106 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152106, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152106 BINDING SITE, designated SEQ ID:14066, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11786] Another function of GAM72 is therefore inhibition of LOC152106 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152106.

[11787] LOC152283 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC152283 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152283, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152283 BINDING SITE, designated SEQ ID:18445, to

the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11788] Another function of GAM72 is therefore inhibition of LOC152283 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152283.

[11789] LOC152441 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC152441 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152441, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152441 BINDING SITE, designated SEQ ID:10381, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11790] Another function of GAM72 is therefore inhibition of LOC152441 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152441.

[11791] LOC152445 (Accession XM_098231.1) is another GAM72 target gene, herein designated TARGET GENE. LOC152445 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC152445, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152445 BINDING SITE, designated SEQ ID:733, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11792] Another function of GAM72 is therefore inhibition of LOC152445 (Accession XM_098231.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152445.

[11793] LOC152453 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC152453 BINDING SITE1 and LOC152453 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC152453, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152453 BINDING SITE1 and LOC152453 BINDING SITE2, designated SEQ ID:6507 and SEQ ID:7673 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated

SEQ ID:342.

[11794] Another function of GAM72 is therefore inhibition of LOC152453 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152453.

[11795] LOC152627 (Accession XM_087495.1) is another GAM72 target gene, herein designated TARGET GENE. LOC152627 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC152627, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152627 BINDING SITE, designated SEQ ID:16737, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11796] Another function of GAM72 is therefore inhibition of LOC152627 (Accession XM_087495.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152627.

[11797] LOC152804 (Accession XM_098266.5) is another GAM72 target gene, herein designated TARGET GENE. LOC152804 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC152804, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152804 BINDING SITE, designated SEQ ID:11713, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11798] Another function of GAM72 is therefore inhibition of LOC152804 (Accession XM_098266.5) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152804.

[11799] LOC153077 (Accession XM_098307.1) is another GAM72 target gene, herein designated TARGET GENE. LOC153077 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153077, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153077 BINDING SITE, designated SEQ ID:4690, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11800] Another function of GAM72 is therefore inhibition of

LOC153077 (Accession XM_098307.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153077.

[11801] LOC153561 (Accession XM_087708.6) is another GAM72 target gene, herein designated TARGET GENE. LOC153561 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153561, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153561 BINDING SITE, designated SEQ ID:8086, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11802] Another function of GAM72 is therefore inhibition of LOC153561 (Accession XM_087708.6) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153561.

[11803] LOC153642 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC153642 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153642, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153642 BINDING SITE, designated SEQ ID:1185, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11804] Another function of GAM72 is therefore inhibition of LOC153642 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153642.

[11805] LOC153684 (Accession XM_098412.1) is another GAM72 target gene, herein designated TARGET GENE. LOC153684 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153684, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153684 BINDING SITE, designated SEQ ID:6747, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11806] Another function of GAM72 is therefore inhibition of LOC153684 (Accession XM_098412.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC153684.

[11807] LOC153727 (Accession XM_098422.1) is another GAM72 target gene, herein designated TARGET GENE. LOC153727 BINDING SITE1 and LOC153727 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC153727, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153727 BINDING SITE1 and LOC153727 BINDING SITE2, designated SEQ ID:18363 and SEQ ID:5172 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11808] Another function of GAM72 is therefore inhibition of LOC153727 (Accession XM_098422.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153727.

[11809] LOC153733 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC153733 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153733, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153733 BINDING SITE, designated SEQ ID:5167, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11810] Another function of GAM72 is therefore inhibition of LOC153733 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153733.

[11811] LOC154089 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC154089 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC154089, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154089 BINDING SITE, designated SEQ ID:8087, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11812] Another function of GAM72 is therefore inhibition of LOC154089 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with LOC154089.

[11813] LOC154092 (Accession XM_098466.1) is another GAM72 target gene, herein designated TARGET GENE. LOC154092 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC154092, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154092 BINDING SITE, designated SEQ ID:8225, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11814] Another function of GAM72 is therefore inhibition of LOC154092 (Accession XM_098466.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154092.

[11815] LOC154403 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC154403 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC154403, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC154403 BINDING SITE, designated SEQ ID:7519, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11816] Another function of GAM72 is therefore inhibition of LOC154403 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154403.

[11817] LOC154739 (Accession XM_098602.1) is another GAM72 target gene, herein designated TARGET GENE. LOC154739 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC154739, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154739 BINDING SITE, designated SEQ ID:9325, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11818] Another function of GAM72 is therefore inhibition of LOC154739 (Accession XM_098602.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154739.

[11819] LOC154992 (Accession) is another GAM72 target gene,

herein designated TARGET GENE. LOC154992 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC154992, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154992 BINDING SITE, designated SEQ ID:16364, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11820] Another function of GAM72 is therefore inhibition of LOC154992 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154992.

[11821] LOC155376 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC155376 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC155376, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC155376 BINDING SITE, designated SEQ ID:17561, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11822] Another function of GAM72 is therefore inhibition of LOC155376 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155376.

[11823] LOC155438 (Accession XM_098722.1) is another GAM72 target gene, herein designated TARGET GENE. LOC155438 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC155438, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC155438 BINDING SITE, designated SEQ ID:5623, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11824] Another function of GAM72 is therefore inhibition of LOC155438 (Accession XM_098722.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155438.

[11825] LOC157247 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC157247 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157247, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157247 BINDING SITE, designated SEQ ID:5887, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11826] Another function of GAM72 is therefore inhibition of LOC157247 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157247.

[11827] LOC157562 (Accession XM_098779.1) is another GAM72 target gene, herein designated TARGET GENE. LOC157562 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC157562, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157562 BINDING SITE, designated SEQ ID:12425, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11828] Another function of GAM72 is therefore inhibition of LOC157562 (Accession XM_098779.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC157562.

[11829] LOC158160 (Accession XM_054490.2) is another GAM72 target gene, herein designated TARGET GENE. LOC158160 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158160, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158160 BINDING SITE, designated SEQ ID:10160, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11830] Another function of GAM72 is therefore inhibition of LOC158160 (Accession XM_054490.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158160.

[11831] LOC158235 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC158235 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158235, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of LOC158235 BINDING SITE, designated SEQ ID:13710, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11832] Another function of GAM72 is therefore inhibition of LOC158235 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158235.

[11833] LOC158288 (Accession XM_098912.2) is another GAM72 target gene, herein designated TARGET GENE. LOC158288 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158288, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158288 BINDING SITE, designated SEQ ID:15611, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11834] Another function of GAM72 is therefore inhibition of LOC158288 (Accession XM_098912.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158288.

[11835] LOC158382 (Accession XM_098931.4) is another GAM72 target gene, herein designated TARGET GENE. LOC158382 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158382, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158382 BINDING SITE, designated SEQ ID:427, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11836] Another function of GAM72 is therefore inhibition of LOC158382 (Accession XM_098931.4) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158382.

[11837] LOC158434 (Accession XM_098939.1) is another GAM72 target gene, herein designated TARGET GENE. LOC158434 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158434, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158434 BINDING SITE, designated SEQ ID:5974, to

the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11838] Another function of GAM72 is therefore inhibition of LOC158434 (Accession XM_098939.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158434.

[11839] LOC158677 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC158677 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC158677, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158677 BINDING SITE, designated SEQ ID:9473, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11840] Another function of GAM72 is therefore inhibition of LOC158677 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158677.

[11841] LOC158863 (Accession XM_098999.2) is another GAM72 target gene, herein designated TARGET GENE. LOC158863

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158863, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158863 BINDING SITE, designated SEQ ID:4611, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11842] Another function of GAM72 is therefore inhibition of LOC158863 (Accession XM_098999.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158863.

[11843] LOC158987 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC158987 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158987, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158987 BINDING SITE, designated SEQ ID:10126, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11844] Another function of GAM72 is therefore inhibition of LOC158987 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158987.

[11845] LOC159053 (Accession XM_099021.1) is another GAM72 target gene, herein designated TARGET GENE. LOC159053 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC159053, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC159053 BINDING SITE, designated SEQ ID:14881, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11846] Another function of GAM72 is therefore inhibition of LOC159053 (Accession XM_099021.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159053.

[11847] LOC159116 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC159116 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC159116, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC159116 BINDING SITE, designated SEQ ID:16091, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11848] Another function of GAM72 is therefore inhibition of LOC159116 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159116.

[11849] LOC160646 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC160646 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC160646, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC160646 BINDING SITE, designated SEQ ID:15754, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11850] Another function of GAM72 is therefore inhibition of LOC160646 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with LOC160646.

[11851] LOC166219 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC166219 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC166219, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC166219 BINDING SITE, designated SEQ ID:9359, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11852] Another function of GAM72 is therefore inhibition of LOC166219 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166219.

[11853] LOC196027 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC196027 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196027, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196027 BINDING SITE, designated SEQ ID:13986, to

the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11854] Another function of GAM72 is therefore inhibition of LOC196027 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196027.

[11855] LOC196761 (Accession XM_116865.1) is another GAM72 target gene, herein designated TARGET GENE. LOC196761 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC196761, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC196761 BINDING SITE, designated SEQ ID:17150, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11856] Another function of GAM72 is therefore inhibition of LOC196761 (Accession XM_116865.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196761.

[11857] LOC197196 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC197196 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197196, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197196 BINDING SITE, designated SEQ ID:8418, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11858] Another function of GAM72 is therefore inhibition of LOC197196 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197196.

[11859] LOC197319 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC197319 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197319, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197319 BINDING SITE, designated SEQ ID:19926, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11860] Another function of GAM72 is therefore inhibition of

LOC197319 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197319.

[11861] LOC197335 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC197335 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197335, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197335 BINDING SITE, designated SEQ ID:12694, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11862] Another function of GAM72 is therefore inhibition of LOC197335 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197335.

[11863] LOC197408 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC197408 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC197408, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of LOC197408 BINDING SITE, designated SEQ ID:13833, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11864] Another function of GAM72 is therefore inhibition of LOC197408 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197408.

[11865] LOC200014 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC200014 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200014, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200014 BINDING SITE, designated SEQ ID:19993, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11866] Another function of GAM72 is therefore inhibition of LOC200014 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200014.

[11867] LOC200282 (Accession) is another GAM72 target gene,

herein designated TARGET GENE. LOC200282 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200282, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200282 BINDING SITE, designated SEQ ID:13981, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11868] Another function of GAM72 is therefore inhibition of LOC200282 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200282.

[11869] LOC200731 (Accession XM_117268.1) is another GAM72 target gene, herein designated TARGET GENE. LOC200731 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200731, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200731 BINDING SITE, designated SEQ ID:10206, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11870] Another function of GAM72 is therefore inhibition of LOC200731 (Accession XM_117268.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200731.

[11871] LOC200803 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC200803 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC200803, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC200803 BINDING SITE, designated SEQ ID:7883, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11872] Another function of GAM72 is therefore inhibition of LOC200803 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200803.

[11873] LOC201868 (Accession XM_114393.2) is another GAM72 target gene, herein designated TARGET GENE. LOC201868 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC201868, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201868 BINDING SITE, designated SEQ ID:6971, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11874] Another function of GAM72 is therefore inhibition of LOC201868 (Accession XM_114393.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201868.

[11875] LOC201931 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC201931 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC201931, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201931 BINDING SITE, designated SEQ ID:19292, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11876] Another function of GAM72 is therefore inhibition of LOC201931 (Accession) . Accordingly, utilities of GAM72

include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201931.

[11877] LOC202134 (Accession XM_117365.5) is another GAM72 target gene, herein designated TARGET GENE. LOC202134 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC202134, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC202134 BINDING SITE, designated SEQ ID:8165, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11878] Another function of GAM72 is therefore inhibition of LOC202134 (Accession XM_117365.5) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202134.

[11879] LOC202781 (Accession XM_117455.3) is another GAM72 target gene, herein designated TARGET GENE. LOC202781 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC202781, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC202781 BINDING SITE, designated SEQ ID:15090, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11880] Another function of GAM72 is therefore inhibition of LOC202781 (Accession XM_117455.3) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202781.

[11881] LOC203350 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC203350 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC203350, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC203350 BINDING SITE, designated SEQ ID:12836, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11882] Another function of GAM72 is therefore inhibition of LOC203350 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203350.

[11883] LOC203378 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC203378 BINDING SITE1 and LOC203378 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC203378, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE1 and LOC203378 BINDING SITE2, designated SEQ ID:19699 and SEQ ID:8136 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11884] Another function of GAM72 is therefore inhibition of LOC203378 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378.

[11885] LOC203397 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC203397 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC203397, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC203397 BINDING SITE, designated SEQ ID:2611, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11886] Another function of GAM72 is therefore inhibition of LOC203397 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203397.

[11887] LOC219649 (Accession XM_167562.1) is another GAM72 target gene, herein designated TARGET GENE. LOC219649 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC219649, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219649 BINDING SITE, designated SEQ ID:17944, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11888] Another function of GAM72 is therefore inhibition of LOC219649 (Accession XM_167562.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219649.

[11889] LOC220370 (Accession) is another GAM72 target gene,

herein designated TARGET GENE. LOC220370 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220370, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220370 BINDING SITE, designated SEQ ID:10212, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11890] Another function of GAM72 is therefore inhibition of LOC220370 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220370.

[11891] LOC220662 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC220662 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220662, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220662 BINDING SITE, designated SEQ ID:14876, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11892] Another function of GAM72 is therefore inhibition of LOC220662 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220662.

[11893] LOC221069 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC221069 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221069, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221069 BINDING SITE, designated SEQ ID:877, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11894] Another function of GAM72 is therefore inhibition of LOC221069 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221069.

[11895] LOC221271 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC221271 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221271, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221271 BINDING SITE, designated SEQ ID:18966, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11896] Another function of GAM72 is therefore inhibition of LOC221271 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221271.

[11897] LOC221641 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC221641 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221641, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221641 BINDING SITE, designated SEQ ID:4135, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11898] Another function of GAM72 is therefore inhibition of LOC221641 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221641.

[11899] LOC221943 (Accession XM_168343.1) is another GAM72 target gene, herein designated TARGET GENE. LOC221943 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221943, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221943 BINDING SITE, designated SEQ ID:17821, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11900] Another function of GAM72 is therefore inhibition of LOC221943 (Accession XM_168343.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221943.

[11901] LOC221946 (Accession XM_168340.2) is another GAM72 target gene, herein designated TARGET GENE. LOC221946 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC221946, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221946 BINDING SITE, designated SEQ ID:18979, to

the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11902] Another function of GAM72 is therefore inhibition of LOC221946 (Accession XM_168340.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221946.

[11903] LOC222060 (Accession XM_168427.2) is another GAM72 target gene, herein designated TARGET GENE. LOC222060 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC222060, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222060 BINDING SITE, designated SEQ ID:8977, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11904] Another function of GAM72 is therefore inhibition of LOC222060 (Accession XM_168427.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222060.

[11905] LOC222066 (Accession) is another GAM72 target gene,

herein designated TARGET GENE. LOC222066 BINDING SITE1 and LOC222066 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC222066, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222066 BINDING SITE1 and LOC222066 BINDING SITE2, designated SEQ ID:14380 and SEQ ID:11966 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11906] Another function of GAM72 is therefore inhibition of LOC222066 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222066.

[11907] LOC222160 (Accession XM_168431.1) is another GAM72 target gene, herein designated TARGET GENE. LOC222160 BINDING SITE1 and LOC222160 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC222160, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222160 BINDING SITE1

and LOC222160 BINDING SITE2, designated SEQ ID:6925 and SEQ ID:4691 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11908] Another function of GAM72 is therefore inhibition of LOC222160 (Accession XM_168431.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222160.

[11909] LOC222237 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC222237 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC222237, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222237 BINDING SITE, designated SEQ ID:10341, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11910] Another function of GAM72 is therefore inhibition of LOC222237 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222237.

[11911] LOC222256 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC222256 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC222256, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC222256 BINDING SITE, designated SEQ ID:15689, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11912] Another function of GAM72 is therefore inhibition of LOC222256 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222256.

[11913] LOC253840 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC253840 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC253840, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC253840 BINDING SITE, designated SEQ ID:10077, to the nucleotide sequence of GAM72 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:342.

[11914] Another function of GAM72 is therefore inhibition of LOC253840 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253840.

[11915] LOC254045 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC254045 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254045, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254045 BINDING SITE, designated SEQ ID:7566, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11916] Another function of GAM72 is therefore inhibition of LOC254045 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254045.

[11917] LOC254100 (Accession XM_172851.1) is another GAM72 target gene, herein designated TARGET GENE. LOC254100 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254100, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254100 BINDING SITE, designated SEQ ID:1555, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11918] Another function of GAM72 is therefore inhibition of LOC254100 (Accession XM_172851.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254100.

[11919] LOC255031 (Accession XM_173187.2) is another GAM72 target gene, herein designated TARGET GENE. LOC255031 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255031, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255031 BINDING SITE, designated SEQ ID:4612, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11920] Another function of GAM72 is therefore inhibition of LOC255031 (Accession XM_173187.2) . Accordingly, utili-

ties of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255031.

[11921] LOC255042 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC255042 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255042, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255042 BINDING SITE, designated SEQ ID:18961, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11922] Another function of GAM72 is therefore inhibition of LOC255042 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255042.

[11923] LOC255326 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC255326 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255326, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of LOC255326 BINDING SITE, designated SEQ ID:16738, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11924] Another function of GAM72 is therefore inhibition of LOC255326 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255326.

[11925] LOC255328 (Accession XM_172920.1) is another GAM72 target gene, herein designated TARGET GENE. LOC255328 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255328, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255328 BINDING SITE, designated SEQ ID:4607, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11926] Another function of GAM72 is therefore inhibition of LOC255328 (Accession XM_172920.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255328.

[11927] LOC255463 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC255463 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255463, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255463 BINDING SITE, designated SEQ ID:11708, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11928] Another function of GAM72 is therefore inhibition of LOC255463 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255463.

[11929] LOC255798 (Accession XM_173087.2) is another GAM72 target gene, herein designated TARGET GENE. LOC255798 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255798, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255798 BINDING SITE, designated SEQ ID:18840, to the nucleotide sequence of GAM72 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:342.

[11930] Another function of GAM72 is therefore inhibition of LOC255798 (Accession XM_173087.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255798.

[11931] LOC255937 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC255937 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC255937, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255937 BINDING SITE, designated SEQ ID:1366, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11932] Another function of GAM72 is therefore inhibition of LOC255937 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255937.

[11933] LOC255971 (Accession XM_172907.1) is another GAM72 target gene, herein designated TARGET GENE. LOC255971 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC255971, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC255971 BINDING SITE, designated SEQ ID:15032, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11934] Another function of GAM72 is therefore inhibition of LOC255971 (Accession XM_172907.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255971.

[11935] LOC256515 (Accession XM_172866.1) is another GAM72 target gene, herein designated TARGET GENE. LOC256515 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC256515, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256515 BINDING SITE, designated SEQ ID:16314, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11936] Another function of GAM72 is therefore inhibition of

LOC256515 (Accession XM_172866.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256515.

[11937] LOC256520 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC256520 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC256520, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256520 BINDING SITE, designated SEQ ID:15534, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11938] Another function of GAM72 is therefore inhibition of LOC256520 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256520.

[11939] LOC256544 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC256544 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC256544, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256544 BINDING SITE, designated SEQ ID:3768, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11940] Another function of GAM72 is therefore inhibition of LOC256544 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256544.

[11941] LOC257354 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC257354 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC257354, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257354 BINDING SITE, designated SEQ ID:14050, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11942] Another function of GAM72 is therefore inhibition of LOC257354 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257354.

[11943] LOC257448 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC257448 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC257448, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257448 BINDING SITE, designated SEQ ID:14619, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11944] Another function of GAM72 is therefore inhibition of LOC257448 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257448.

[11945] LOC257596 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC257596 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC257596, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC257596 BINDING SITE, designated SEQ ID:10276, to the nucleotide sequence of GAM72 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:342.

[11946] Another function of GAM72 is therefore inhibition of LOC257596 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257596.

[11947] LOC51122 (Accession NM_016094.1) is another GAM72 target gene, herein designated TARGET GENE. LOC51122 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51122, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51122 BINDING SITE, designated SEQ ID:15769, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11948] Another function of GAM72 is therefore inhibition of LOC51122 (Accession NM_016094.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51122.

[11949] LOC51145 (Accession NM_016158.1) is another GAM72 target gene, herein designated TARGET GENE. LOC51145 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC51145, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51145 BINDING SITE, designated SEQ ID:19694, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11950] Another function of GAM72 is therefore inhibition of LOC51145 (Accession NM_016158.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51145.

[11951] LOC51212 (Accession NM_016380.1) is another GAM72 target gene, herein designated TARGET GENE. LOC51212 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51212, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51212 BINDING SITE, designated SEQ ID:3156, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11952] Another function of GAM72 is therefore inhibition of

LOC51212 (Accession NM_016380.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51212.

[11953] LOC51279 (Accession NM_016546.1) is another GAM72 target gene, herein designated TARGET GENE. LOC51279 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51279, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51279 BINDING SITE, designated SEQ ID:16733, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11954] Another function of GAM72 is therefore inhibition of LOC51279 (Accession NM_016546.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51279.

[11955] LOC51333 (Accession NM_016643.1) is another GAM72 target gene, herein designated TARGET GENE. LOC51333 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51333, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51333 BINDING SITE, designated SEQ ID:8944, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11956] Another function of GAM72 is therefore inhibition of LOC51333 (Accession NM_016643.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51333.

[11957] LOC51716 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC51716 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC51716, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC51716 BINDING SITE, designated SEQ ID:8066, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11958] Another function of GAM72 is therefore inhibition of LOC51716 (Accession) . Accordingly, utilities of GAM72

include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51716.

[11959] LOC89958 (Accession XM_027627.4) is another GAM72 target gene, herein designated TARGET GENE. LOC89958 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC89958, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC89958 BINDING SITE, designated SEQ ID:4295, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11960] Another function of GAM72 is therefore inhibition of LOC89958 (Accession XM_027627.4) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89958.

[11961] LOC90092 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC90092 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90092, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of LOC90092 BINDING SITE, designated SEQ ID:5975, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11962] Another function of GAM72 is therefore inhibition of LOC90092 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90092.

[11963] LOC90141 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC90141 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90141, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90141 BINDING SITE, designated SEQ ID:3769, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11964] Another function of GAM72 is therefore inhibition of LOC90141 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90141.

[11965] LOC90333 (Accession XM_030958.6) is another GAM72

target gene, herein designated TARGET GENE. LOC90333 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90333, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90333 BINDING SITE, designated SEQ ID:4608, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11966] Another function of GAM72 is therefore inhibition of LOC90333 (Accession XM_030958.6) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90333.

[11967] LOC90573 (Accession XM_032669.1) is another GAM72 target gene, herein designated TARGET GENE. LOC90573 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90573, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90573 BINDING SITE, designated SEQ ID:8294, to the nucleotide sequence of GAM72 RNA, herein designated

GAM RNA, also designated SEQ ID:342.

[11968] Another function of GAM72 is therefore inhibition of LOC90573 (Accession XM_032669.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90573.

[11969] LOC90589 (Accession NM_145233.1) is another GAM72 target gene, herein designated TARGET GENE. LOC90589 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90589, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90589 BINDING SITE, designated SEQ ID:8082, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11970] Another function of GAM72 is therefore inhibition of LOC90589 (Accession NM_145233.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90589.

[11971] LOC90624 (Accession XM_033003.4) is another GAM72 target gene, herein designated TARGET GENE. LOC90624

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90624, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90624 BINDING SITE, designated SEQ ID:4899, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11972] Another function of GAM72 is therefore inhibition of LOC90624 (Accession XM_033003.4) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90624.

[11973] LOC90777 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC90777 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90777, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90777 BINDING SITE, designated SEQ ID:18233, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11974] Another function of GAM72 is therefore inhibition of LOC90777 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90777.

[11975] LOC90784 (Accession XM_034109.2) is another GAM72 target gene, herein designated TARGET GENE. LOC90784 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC90784, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90784 BINDING SITE, designated SEQ ID:8897, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11976] Another function of GAM72 is therefore inhibition of LOC90784 (Accession XM_034109.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90784.

[11977] LOC91380 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC91380 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91380, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91380 BINDING SITE, designated SEQ ID:15283, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11978] Another function of GAM72 is therefore inhibition of LOC91380 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91380.

[11979] LOC91397 (Accession XM_038219.2) is another GAM72 target gene, herein designated TARGET GENE. LOC91397 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91397, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91397 BINDING SITE, designated SEQ ID:18139, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11980] Another function of GAM72 is therefore inhibition of LOC91397 (Accession XM_038219.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC91397.

[11981] LOC91442 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC91442 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91442, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91442 BINDING SITE, designated SEQ ID:4045, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11982] Another function of GAM72 is therefore inhibition of LOC91442 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91442.

[11983] LOC91565 (Accession XM_039231.1) is another GAM72 target gene, herein designated TARGET GENE. LOC91565 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC91565, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC91565 BINDING SITE, designated SEQ ID:19839, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11984] Another function of GAM72 is therefore inhibition of LOC91565 (Accession XM_039231.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91565.

[11985] LOC91862 (Accession NM_052858.1) is another GAM72 target gene, herein designated TARGET GENE. LOC91862 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91862, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91862 BINDING SITE, designated SEQ ID:14448, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11986] Another function of GAM72 is therefore inhibition of LOC91862 (Accession NM_052858.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91862.

[11987] LOC91948 (Accession XM_041723.1) is another GAM72 target gene, herein designated TARGET GENE. LOC91948 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91948, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91948 BINDING SITE, designated SEQ ID:17556, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11988] Another function of GAM72 is therefore inhibition of LOC91948 (Accession XM_041723.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91948.

[11989] LOC92223 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC92223 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92223, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92223 BINDING SITE, designated SEQ ID:10868, to the nucleotide

sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11990] Another function of GAM72 is therefore inhibition of LOC92223 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92223.

[11991] LOC92465 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC92465 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC92465, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92465 BINDING SITE, designated SEQ ID:16877, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11992] Another function of GAM72 is therefore inhibition of LOC92465 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92465.

[11993] LOC92568 (Accession XM_045852.1) is another GAM72 target gene, herein designated TARGET GENE. LOC92568 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC92568, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92568 BINDING SITE, designated SEQ ID:12413, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11994] Another function of GAM72 is therefore inhibition of LOC92568 (Accession XM_045852.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92568.

[11995] LOC92661 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC92661 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC92661, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92661 BINDING SITE, designated SEQ ID:16307, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11996] Another function of GAM72 is therefore inhibition of

LOC92661 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92661.

[11997] LOC92771 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LOC92771 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92771, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92771 BINDING SITE, designated SEQ ID:8166, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[11998] Another function of GAM72 is therefore inhibition of LOC92771 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92771.

[11999] LOC93132 (Accession XM_049396.2) is another GAM72 target gene, herein designated TARGET GENE. LOC93132 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC93132, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of LOC93132 BINDING SITE, designated SEQ ID:2241, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12000] Another function of GAM72 is therefore inhibition of LOC93132 (Accession XM_049396.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93132.

[12001] LOC96597 (Accession XM_039922.2) is another GAM72 target gene, herein designated TARGET GENE. LOC96597 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC96597, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC96597 BINDING SITE, designated SEQ ID:18099, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12002] Another function of GAM72 is therefore inhibition of LOC96597 (Accession XM_039922.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC96597.

[12003] Leucine rich repeat (in flii) interacting protein 1 (LRRFIP1, Accession NM_004735.1) is another GAM72 target gene, herein designated TARGET GENE. LRRFIP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LRRFIP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LRRFIP1 BINDING SITE, designated SEQ ID:15700, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12004] Another function of GAM72 is therefore inhibition of Leucine rich repeat (in flii) interacting protein 1 (LRRFIP1, Accession NM_004735.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRFIP1.

[12005] LSR68 (Accession) is another GAM72 target gene, herein designated TARGET GENE. LSR68 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LSR68, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of LSR68 BINDING SITE, designated SEQ ID:4233, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12006] Another function of GAM72 is therefore inhibition of LSR68 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LSR68.

[12007] Mannan-binding lectin serine protease 1 (c4/c2 activating component of ra-reactive factor) (MASP1, Accession NM_001879.3) is another GAM72 target gene, herein designated TARGET GENE. MASP1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MASP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MASP1 BINDING SITE, designated SEQ ID:9106, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12008] Another function of GAM72 is therefore inhibition of Mannan-binding lectin serine protease 1 (c4/c2 activating component of ra-reactive factor) (MASP1, Accession NM_001879.3), a gene which a complement- dependent

bactericidal factor . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MASP1.

[12009] The function of MASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.MAWBP (Accession NM_022129.1) is another GAM72 target gene, herein designated TARGET GENE. MAWBP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MAWBP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MAWBP BINDING SITE, designated SEQ ID:1896, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12010] Another function of GAM72 is therefore inhibition of MAWBP (Accession NM_022129.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAWBP.

[12011] MED6 (Accession NM_005466.1) is another GAM72 target gene, herein designated TARGET GENE. MED6 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by MED6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MED6 BINDING SITE, designated SEQ ID:14033, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12012] Another function of GAM72 is therefore inhibition of MED6 (Accession NM_005466.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MED6.

[12013] Mesoderm development candidate 2 (MESDC2, Accession XM_051854.3) is another GAM72 target gene, herein designated TARGET GENE. MESDC2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MESDC2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MESDC2 BINDING SITE, designated SEQ ID:5973, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12014] Another function of GAM72 is therefore inhibition of

Mesoderm development candidate 2 (MESDC2, Accession XM_051854.3) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MESDC2.

[12015] MGC10999 (Accession NM_032307.1) is another GAM72 target gene, herein designated TARGET GENE. MGC10999 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC10999, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10999 BINDING SITE, designated SEQ ID:15448, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12016] Another function of GAM72 is therefore inhibition of MGC10999 (Accession NM_032307.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10999.

[12017] MGC11287 (Accession) is another GAM72 target gene, herein designated TARGET GENE. MGC11287 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC11287, corresponding to

a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC11287 BINDING SITE, designated SEQ ID:4413, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12018] Another function of GAM72 is therefore inhibition of MGC11287 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11287.

[12019] MGC15631 (Accession NM_032753.2) is another GAM72 target gene, herein designated TARGET GENE. MGC15631 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC15631, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC15631 BINDING SITE, designated SEQ ID:2277, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12020] Another function of GAM72 is therefore inhibition of MGC15631 (Accession NM_032753.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC15631.

[12021] MGC16037 (Accession NM_032887.1) is another GAM72 target gene, herein designated TARGET GENE. MGC16037 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC16037, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC16037 BINDING SITE, designated SEQ ID:11316, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12022] Another function of GAM72 is therefore inhibition of MGC16037 (Accession NM_032887.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16037.

[12023] MGC20235 (Accession NM_145041.1) is another GAM72 target gene, herein designated TARGET GENE. MGC20235 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC20235, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of MGC20235 BINDING SITE, designated SEQ ID:8637, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12024] Another function of GAM72 is therefore inhibition of MGC20235 (Accession NM_145041.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20235.

[12025] MGC26641 (Accession NM_144971.1) is another GAM72 target gene, herein designated TARGET GENE. MGC26641 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC26641, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC26641 BINDING SITE, designated SEQ ID:14080, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12026] Another function of GAM72 is therefore inhibition of MGC26641 (Accession NM_144971.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC26641.

[12027] MGC29891 (Accession NM_144618.1) is another GAM72 target gene, herein designated TARGET GENE. MGC29891 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC29891, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC29891 BINDING SITE, designated SEQ ID:20056, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12028] Another function of GAM72 is therefore inhibition of MGC29891 (Accession NM_144618.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC29891.

[12029] MGC3169 (Accession NM_024074.1) is another GAM72 target gene, herein designated TARGET GENE. MGC3169 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC3169, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MGC3169 BINDING SITE, designated SEQ ID:403, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12030] Another function of GAM72 is therefore inhibition of MGC3169 (Accession NM_024074.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3169.

[12031] MGC39350 (Accession NM_144970.1) is another GAM72 target gene, herein designated TARGET GENE. MGC39350 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC39350, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC39350 BINDING SITE, designated SEQ ID:16509, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12032] Another function of GAM72 is therefore inhibition of MGC39350 (Accession NM_144970.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC39350.

[12033] MGC4368 (Accession NM_024510.2) is another GAM72 target gene, herein designated TARGET GENE. MGC4368 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4368, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4368 BINDING SITE, designated SEQ ID:8406, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12034] Another function of GAM72 is therefore inhibition of MGC4368 (Accession NM_024510.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4368.

[12035] MGC4562 (Accession NM_133375.1) is another GAM72 target gene, herein designated TARGET GENE. MGC4562 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4562, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4562 BINDING SITE, designated SEQ ID:12121, to the

nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12036] Another function of GAM72 is therefore inhibition of MGC4562 (Accession NM_133375.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4562.

[12037] MGC4771 (Accession NM_032668.1) is another GAM72 target gene, herein designated TARGET GENE. MGC4771 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4771, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4771 BINDING SITE, designated SEQ ID:18399, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12038] Another function of GAM72 is therefore inhibition of MGC4771 (Accession NM_032668.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4771.

[12039] MGC4840 (Accession NM_031490.1) is another GAM72

target gene, herein designated TARGET GENE. MGC4840 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC4840, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC4840 BINDING SITE, designated SEQ ID:18803, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12040] Another function of GAM72 is therefore inhibition of MGC4840 (Accession NM_031490.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4840.

[12041] MGC5457 (Accession NM_032633.1) is another GAM72 target gene, herein designated TARGET GENE. MGC5457 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC5457, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC5457 BINDING SITE, designated SEQ ID:17297, to the nucleotide sequence of GAM72 RNA, herein designated

GAM RNA, also designated SEQ ID:342.

[12042] Another function of GAM72 is therefore inhibition of MGC5457 (Accession NM_032633.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5457.

[12043] MIR16 (Accession NM_016641.2) is another GAM72 target gene, herein designated TARGET GENE. MIR16 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MIR16, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MIR16 BINDING SITE, designated SEQ ID:10113, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12044] Another function of GAM72 is therefore inhibition of MIR16 (Accession NM_016641.2), a gene which is a membrane interacting protein. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIR16.

[12045] The function of MIR16 has been established by previous studies. Using a yeast 2- hybrid screen to identify pro-

teins that interact with RGS16 (OMIM Ref. No. 602514), Zheng et al. (2000) isolated a cDNA encoding rat Mir16. By searching sequence databases with rat Mir16 as the probe, they identified a cDNA encoding human MIR16 that had been reported by Loftus et al. (1999) as part of a large- scale chromosome 16 sequencing effort. The human MIR16 protein shares 94% amino acid similarity with rat MIR16 and also shares strong homology with bacterial glycerophosphodiester phosphodiesterases. Northern blot analysis detected widespread expression of a 1.8- kb Mir16 transcript in rat tissues, with highest levels in heart, brain, liver, kidney, and testis. Similar expression was observed for human and mouse MIR16. Using yeast 2- hybrid and GST pull- down assays, Zheng et al. (2000) demonstrated that MIR16 interacts with the RGS domain of RGS16 and weakly with other RGS proteins, including RGS2 (OMIM Ref. No. 600861). Membrane association assays and endoglycosidase H digestion showed that MIR16 is an integral membrane glycoprotein. Immunofluorescence and immunoelectron microscopy localized Mir16 in the intracellular membranes in rat pituitary and on the plasma membrane in rat liver and kidney. By genomic sequence analysis, Loftus et al. (1999) mapped the MIR16

gene to chromosome 16p.

[12046]

[12047] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12048] Loftus, B. J.; Kim, U.- J.; Sneddon, V. P.; Kalush, F.; Brandon, R.; Fuhrmann, J.; Mason, T.; Crosby, M. L.; Barnstead, M.; Cronin, L.; Mays, A. D.; Cao, Y.; Xu, R. X.; Kang, H.- L.; Mitchell, S.; Eichler, E. E.; Harris, P. C.; Venter, J. C.; Adams, M. D. : Genome duplications and other features in 12 Mb of DNA sequence from human chromosome 16p and 16q. Genomics 60: 295- 308, 1999. ; and

[12049] Zheng, B.; Chen, D.; Farquhar, M. G. : MIR16, a putative membrane glycerophosphodiester phosphodiesterase, interacts with RGS16. Proc. Nat. Acad. Sci. 97: 3999- 4004, 2000.

[12050] Further studies establishing the function and utilities of MIR16 are found in John Hopkins OMIM database record ID 605943, and in cited publications listed in Table 5, which are hereby incorporated by reference.Myeloid/lymphoid or mixed-lineage leukemia (trithorax homolog, drosophila); translocated to, 4 (MLLT4, Accession NM_005936.1) is another GAM72 tar-

get gene, herein designated TARGET GENE. MLLT4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MLLT4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MLLT4 BINDING SITE, designated SEQ ID:14447, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12051] Another function of GAM72 is therefore inhibition of Myeloid/lymphoid or mixed-lineage leukemia (trithorax homolog, drosophila); translocated to, 4 (MLLT4, Accession NM_005936.1), a gene which may act as an intracellular signaling component and therefore is associated with Acute leukemias. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Acute leukemias, and of other diseases and clinical conditions associated with MLLT4.

[12052] The function of MLLT4 has been established by previous studies. Most acute leukemias in infancy and at least 5% of acute lymphoblastic leukemias and acute myeloid leukemias of older children and adults show abnormalities of chromosome band 11q23. In these cases, translocation

results in fusion of a gene at 11q23, variously called ALL1, MLL, and the human homolog of Drosophila 'trithorax' (OMIM Ref. No. 159555), with part of a gene on chromosome 4 (OMIM Ref. No. 159557), chromosome 9 (OMIM Ref. No. 159558), or chromosome 19 (OMIM Ref. No. 159556). Prasad et al. (1993) described the cloning and characterization of the 'partner gene' involved in a fourth common translocation involving 11q23, t(6;11)(q27;q23). The gene, designated AF6 by them, was found to be expressed in a variety of cell types and to encode a protein of 1,612 amino acids. The protein contains short stretches rich in proline, charged amino acids, serines, or glutamines. In addition, the AF6 protein contains the GLGF motif shared with several proteins of vertebrates and invertebrates thought to be involved in signal transduction at special cell- cell junctions. Using rapid amplification of cDNA ends (RACE) by PCR, Saha et al. (1995) confirmed the breakpoint in AF6 and identified a cDNA clone that was used as a probe to screen a chromosome 6 cosmid library. By fluorescence in situ hybridization, the single clone that was isolated was found to map distal to the critically deleted region associated with ovarian malignancies (OMIM Ref. No. 167000). AF6 is therefore distinct

from and lies telomeric to that region. This gene is also symbolized MLLT4.

[12053]

[12054] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12055] Prasad, R.; Gu, Y.; Alder, H.; Nakamura, T.; Canaani, O.; Saito, H.; Huebner, K.; Gale, R. P.; Nowell, P. C.; Kuriyama, K.; Miyazaki, Y.; Croce, C. M.; Canaani, E. : Cloning of the ALL- 1 fusion partner, the AF- 6 gene, involved in acute myeloid leukemias with the t(6;11) chromosome translocation. Cancer Res. 53: 5624- 5628, 1993. ; and

[12056] Saha, V.; Lillington, D. M.; Shelling, A. N.; Chaplin, T.; Yaspo, M.- L.; Ganesan, T. S.; Young, B. D. : AF6 gene on chromosome band 6q27 maps distal to the minimal region of deletion in.

[12057] Further studies establishing the function and utilities of MLLT4 are found in John Hopkins OMIM database record ID 159559, and in cited publications listed in Table 5, which are hereby incorporated by reference.MRPL56 (Accession) is another GAM72 target gene, herein designated TARGET GENE. MRPL56 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by MRPL56, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPL56 BINDING SITE, designated SEQ ID:9134, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12058] Another function of GAM72 is therefore inhibition of MRPL56 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL56.

[12059] Mitochondrial ribosomal protein s18b (MRPS18B, Accession NM_014046.2) is another GAM72 target gene, herein designated TARGET GENE. MRPS18B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MRPS18B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPS18B BINDING SITE, designated SEQ ID:18538, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12060] Another function of GAM72 is therefore inhibition of Mi-

tochondrial ribosomal protein s18b (MRPS18B, Accession NM_014046.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS18B.

[12061] Myosin ib (MYO1B, Accession XM_290989.1) is another GAM72 target gene, herein designated TARGET GENE. MYO1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MYO1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYO1B BINDING SITE, designated SEQ ID:9604, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12062] Another function of GAM72 is therefore inhibition of Myosin ib (MYO1B, Accession XM_290989.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO1B.

[12063] NBR2 (Accession NM_005821.2) is another GAM72 target gene, herein designated TARGET GENE. NBR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NBR2, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NBR2 BINDING SITE, designated SEQ ID:6975, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12064] Another function of GAM72 is therefore inhibition of NBR2 (Accession NM_005821.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBR2.

[12065] Nephrosis 1, congenital, finnish type (nephrin) (NPHS1, Accession NM_004646.1) is another GAM72 target gene, herein designated TARGET GENE. NPHS1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NPHS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NPHS1 BINDING SITE, designated SEQ ID:19090, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12066] Another function of GAM72 is therefore inhibition of Nephrosis 1, congenital, finnish type (nephrin) (NPHS1,

Accession NM_004646.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPHS1.

[12067] Nebulin-related anchoring protein (Nrap, Accession NM_006175.2) is another GAM72 target gene, herein designated TARGET GENE. Nrap BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by Nrap, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of Nrap BINDING SITE, designated SEQ ID:915, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12068] Another function of GAM72 is therefore inhibition of Nebulin-related anchoring protein (Nrap, Accession NM_006175.2), a gene which performs an anchoring function to link the terminal actin filaments of myofibrils to protein complexes located beneath the sarcolemma. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Nrap.

[12069] The function of Nrap has been established by previous studies. Nebulin is a family of giant myofibrillar proteins

found within the sarcomeres of skeletal muscle. See (OMIM Ref. No. 161650). Over 95% of the nebulin protein consists of 185 copies of a 35- to 40- amino acid module. Most of the modules are arranged into a higher order repeating sequence termed a 'nebulin super repeat.' By screening a mouse skeletal muscle library with a human nebulin cDNA, Luo et al. (1997) isolated cDNAs encoding a protein that they called 'nebulin- related anchoring protein,' or NRAP. Sequence analysis predicted that NRAP is a 1,175- amino acid protein with a pI of 9.26. The C- terminal half of NRAP includes an actin- binding domain with homology to the nebulin super repeats. The N- terminal region contains a LIM domain, thought to mediate protein- protein interactions. Northern blot analysis of various mouse tissues revealed that NRAP is expressed as a 6- kb mRNA only in skeletal muscle and heart. Antibodies against NRAP recognized a 185- kD band on Western blots of skeletal and cardiac muscle proteins. Using immunofluorescence, Luo et al. (1997) found that NRAP is localized at the myotendinous junction in skeletal muscle and the intercalated disc in cardiac muscle. The authors suggested that NRAP performs an anchoring function, linking the terminal actin filaments of myofibrils to pro-

tein complexes located beneath the sarcolemma. By searching the GenBank database, Luo et al. (1997) identified ESTs encoding the human NRAP homolog. Luo et al. (1997) mapped the human NRAP gene to 10q24- q26 using PCR of a radiation hybrid panel. By analysis of an interspecific backcross, they found that the mouse NRAP gene is located on chromosome 19 in a region showing homology of synteny with the human 10q23- q26 region.

[12070]

[12071] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12072] Luo, G.; Leroy, E.; Kozak, C. A.; Polymeropoulos, M. H.; Horowits, R. : Mapping of the gene (NRAP) encoding N-RAP in the mouse and human genomes. Genomics 45: 229- 232, 1997. ; and

[12073] Luo, G.; Zhang, J. Q.; Nguyen, T.- P.; Herrera, A. H.; Paterson, B.; Horowits, R. : Complete cDNA sequence and tissue localization of N- RAP, a novel nebulin- related protein of striated m.

[12074] Further studies establishing the function and utilities of Nrap are found in John Hopkins OMIM database record ID 602873, and in cited publications listed in Table 5, which

are hereby incorporated by reference.Nucleoporin 62kda (NUP62, Accession NM_012346.2) is another GAM72 target gene, herein designated TARGET GENE. NUP62 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NUP62, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NUP62 BINDING SITE, designated SEQ ID:16510, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12075] Another function of GAM72 is therefore inhibition of Nucleoporin 62kda (NUP62, Accession NM_012346.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP62.

[12076] 2'-5'-oligoadenylate synthetase-like (OASL, Accession NM_003733.1) is another GAM72 target gene, herein designated TARGET GENE. OASL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OASL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of OASL BINDING SITE, designated SEQ ID:17989, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12077] Another function of GAM72 is therefore inhibition of 2'-5'-oligoadenylate synthetase-like (OASL, Accession NM_003733.1), a gene which does not have 2'- 5'- oas activity, but binds double- stranded rna and dna. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OASL.

[12078] The function of OASL has been established by previous studies. 2- prime,5- prime oligoadenylates (2- 5As) bind to and activate RNase L (OMIM Ref. No. 180435), resulting in general RNA degradation and consequent inhibition of protein synthesis. 2- 5As are produced by a well- conserved family of interferon- induced enzymes, the 2- 5A synthetases or OASs. By searching an EST database for sequences related to the human OASs OAS1 (OMIM Ref. No. 164350) and p69OAS, Hartmann et al. (1998) identified a cDNA encoding a protein that they called p59OASL (59-kD 2- 5A synthetase- like protein). The predicted 514-amino acid p59OASL shares a highly conserved N- terminal domain with other OASs. The C- terminal portion of

p59OASL contains 2 ubiquitin- like domains. Northern blot analysis revealed that p59OASL is expressed in most tissues, with the highest levels in primary blood leukocytes and other hematopoietic system tissues, colon, and stomach. p59OASL transcription is induced by interferon. The p59OASL gene contains 6 exons. Exons 1- 5 are similar in structure to exons 3- 7 of OAS1, suggesting that the 2 genes arose from a duplication of an ancestral gene. The thyroid hormone receptors (TRs) are hormone- dependent transcription factors that regulate expression of a variety of specific target genes. In a screen for TR- interacting proteins (TRIPs; OMIM Ref. No. 602933), Lee et al. (1995) identified an OASL cDNA and designated it TRIP14.

[12079]

[12080] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12081] Hartmann, R.; Olsen, H. S.; Widder, S.; Jorgensen, R.; Justesen, J. : p59OASL, a 2- prime- 5- prime oligoadenylate synthetase like protein: a novel human gene related to the 2- prime- 5- prime oligoadenylate synthetase family. Nucleic Acids Res. 26: 4121- 4127, 1998. ; and

[12082] Lee, J. W.; Choi, H.- S.; Gyuris, J.; Brent, R.; Moore, D. D. :

Two classes of proteins dependent on either the presence or absence of thyroid hormone for interaction with the thyroid ho.

[12083] Further studies establishing the function and utilities of OASL are found in John Hopkins OMIM database record ID 603281, and in cited publications listed in Table 5, which are hereby incorporated by reference.Optic atrophy 3 (autosomal recessive, with chorea and spastic paraplegia) (OPA3, Accession NM_025136.1) is another GAM72 target gene, herein designated TARGET GENE. OPA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OPA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OPA3 BINDING SITE, designated SEQ ID:2498, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12084] Another function of GAM72 is therefore inhibition of Optic atrophy 3 (autosomal recessive, with chorea and spastic paraplegia) (OPA3, Accession NM_025136.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with OPA3.

[12085] Purinergic receptor p2x, ligand-gated ion channel, 7 (P2RX7, Accession NM_002562.3) is another GAM72 target gene, herein designated TARGET GENE. P2RX7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by P2RX7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P2RX7 BINDING SITE, designated SEQ ID:17467, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12086] Another function of GAM72 is therefore inhibition of Purinergic receptor p2x, ligand-gated ion channel, 7 (P2RX7, Accession NM_002562.3), a gene which responsible for atp- dependent lysis of macrophages and therefore may be associated with Chronic lymphatic leukemia. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Chronic lymphatic leukemia, and of other diseases and clinical conditions associated with P2RX7.

[12087] The function of P2RX7 has been established by previous studies. Wiley et al. (2002) did a study to ascertain

whether or not a glu496- to- ala (E496A; 1513A- C) single- nucleotide polymorphism that results in loss of function of P2X7 in healthy individuals, was present in leukemic B lymphocytes of patients with chronic lymphatic leukemia (CLL; 151400). They studied genomic DNA from the peripheral blood leukocytes of 36 unrelated individuals with CLL, 4 individuals with familial CLL, and 46 age-matched controls. The prevalence of the polymorphic mutation and the frequency of the mutant allele were 3- fold greater in individuals with CLL than in white, elderly controls. Individuals homozygous for the polymorphic allele had no P2X7 receptor function and heterozygotes had half the normal function of that seen in individuals homozygous for the wildtype allele; amounts of ATP- induced apoptosis varied accordingly. In 2 families in which Wiley et al. (2002) studied a father- son pair and a sister- sister pair with CLL, loss of P2X7 function arose because of inheritance of 1 or 2 1513A- C alleles for P2X7. They concluded that activation of the P2X7 receptor leads to apoptosis of lymphocytes in individuals with CLL, and reduced function of this receptor has an antiapoptotic effect, resulting in an increase in B- cell numbers. Thus, inheritance of a loss- of- function polymorphic mutation at po-

sition 1513 in the P2X7 gene would contribute to the pathogenesis of CLL.

[12088] Animal model experiments lend further support to the function of P2RX7. Solle et al. (2001) generated P2rx7-deficient mice by homologous recombination. Macrophages from the mutant mice were unable to respond to extracellular ATP as measured by fluorescent dye accumulation. In addition, ATP or lipopolysaccharide (LPS) stimulation of macrophages resulted in the accumulation of 35- kD pro- Il1b (OMIM Ref. No. 147720) in amounts comparable to wildtype, but only wildtype macrophages secreted the 17- kD Il1b. Both wildtype and mutant macrophages produced and released the 17- kD form in response to the potassium ionophore nigericin. Likewise, in vivo, mutant mice primed with LPS and challenged with ATP failed to generate significant levels of Il1b. Il6 (OMIM Ref. No. 147620), on the other hand, was produced by the mutant mice in response to LPS but without additional production after ATP challenge, suggesting that ATP affects IL6 production via both P2RX7- dependent and - independent mechanisms.

[12089] It is appreciated that the abovementioned animal model for P2RX7 is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[12090] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12091] Wiley, J. S.; Dao- Ung, L. P.; Gu, B. J.; Sluyter, R.; Shemon, A. N.; Li, C.; Taper, J.; Gallo, J.; Manoharan, A. : A loss- of-function polymorphic mutation in the cytolytic P2X7 receptor gene and chronic lymphocyte leukaemia: a molecular study. Lancet 359: 1114- 1119, 2002. ; and

[12092] Solle, M.; Labasi, J.; Perregaux, D. G.; Stam, E.; Petrushova, N.; Koller, B. H.; Griffiths, R. J.; Gabel, C. A. : Altered cytokine production in mice lacking P2X7 receptors. J. Biol. C.

[12093] Further studies establishing the function and utilities of P2RX7 are found in John Hopkins OMIM database record ID 602566, and in cited publications listed in Table 5, which are hereby incorporated by reference.Pyrimidinergic receptor p2y, g-protein coupled, 6 (P2RY6, Accession NM_176796.1) is another GAM72 target gene, herein designated TARGET GENE. P2RY6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by P2RY6, correspond-

ing to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P2RY6 BINDING SITE, designated SEQ ID:2502, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12094] Another function of GAM72 is therefore inhibition of Pyrimidinergic receptor p2y, g-protein coupled, 6 (P2RY6, Accession NM_176796.1), a gene which mediates cellular responses to nucleotides. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RY6.

[12095] The function of P2RY6 has been established by previous studies. Chang et al. (1995) discovered the first receptor of the P2Y6 type in rat. The human ortholog was identified by Communi et al. (1996). Maier et al. (1997) identified 3 isoforms of P2Y6 cDNA. Two contained the same contiguous open reading frames, but differed in their 5- prime untranslated regions and may, therefore, originate by alternative splicing; the third represented a pseudogene. Analysis of P2Y receptor subtype expression in human bone and 2 osteoblastic cell lines by RT- PCR showed that all known human P2Y receptor subtypes were expressed:

P2Y1 (P2RY1; 601167), P2Y2, P2Y4, P2Y6, and P2Y7 (OMIM Ref. No. 601531). In contrast, analysis of brain-derived cell lines suggested that a selective expression of P2Y receptor subtypes occurs in brain tissue. By somatic cell hybridization, Pidlaoan et al. (1997) mapped the P2RY6 gene to 11q13.3- q13.5. By fluorescence in situ hybridization and by sequence tagged site (STS) mapping using the National Center for Biotechnology Information (NCBI) database, Somers et al. (1997) mapped the P2RY6 gene to 11q13.5, between polymorphic markers D11S1314 and D11S916. Further NCBI database analysis of the P2Y purinoceptor genes revealed that P2RY2 (OMIM Ref. No. 600041) maps within less than 4 cM of P2RY6. This was the first chromosomal clustering of this gene family to be described. By phylogenetic analysis of the P2Y purinoceptor family, Somers et al. (1997) demonstrated the presence of 5 evolutionary branches and suggested the occurrence of an ancient gene duplication event.

[12096]

[12097] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12098] Communi, D.; Parmentier, M.; Boeynaems, J.- M. : Cloning,

functional expression and tissue distribution of the human P2Y6 receptor. Biochem. Biophys. Res. Commun. 222: 303- 308, 1996. ; and

[12099] Maier, R.; Glatz, A.; Mosbacher, J.; Bilbe, G. : Cloning of P2Y6 cDNAs and identification of a pseudogene: comparison of P2Y receptor subtype expression in bone and brain tissues. Bioch.

[12100] Further studies establishing the function and utilities of P2RY6 are found in John Hopkins OMIM database record ID 602451, and in cited publications listed in Table 5, which are hereby incorporated by reference.PB1 (Accession NM_018165.1) is another GAM72 target gene, herein designated TARGET GENE. PB1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PB1 BINDING SITE, designated SEQ ID:12116, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12101] Another function of GAM72 is therefore inhibition of PB1 (Accession NM_018165.1) . Accordingly, utilities of

GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PB1.

[12102] Protocadherin 11 y-linked (PCDH11Y, Accession NM_032972.1) is another GAM72 target gene, herein designated TARGET GENE. PCDH11Y BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PCDH11Y, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDH11Y BINDING SITE, designated SEQ ID:12339, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12103] Another function of GAM72 is therefore inhibition of Protocadherin 11 y-linked (PCDH11Y, Accession NM_032972.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11Y.

[12104] Protocadherin beta 9 (PCDHB9, Accession NM_019119.3) is another GAM72 target gene, herein designated TARGET GENE. PCDHB9 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PCDHB9, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDHB9 BINDING SITE, designated SEQ ID:8982, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12105] Another function of GAM72 is therefore inhibition of Protocadherin beta 9 (PCDHB9, Accession NM_019119.3), a gene which is a potential calcium- dependent cell- adhesion protein. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB9.

[12106] The function of PCDHB9 has been established by previous studies. Cadherins are calcium- dependent cell- cell adhesion molecules that mediate neural cell- cell interactions. Protocadherins constitute a subfamily of nonclassic cadherins. PCDHB9 is a member of the beta cluster of protocadherin genes on 5q31. For specific information on the PCDHB genes, see 604967. Vanhalst et al. (2001) determined that unlike most PCDHB proteins, PCDHB9 has not 1 but 2 PXXP motifs, putative SH3 protein- binding sites, at the end of the conserved region of its cytoplasmic domain.

[12107]

[12108] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12109] Vanhalst, K.; Kools, P.; Eynde, E. V.; van Roy, F. : The human and murine protocadherin- beta one- exon gene families show high evolutionary conservation, despite the difference in gene number. FEBS Lett. 495: 120- 125, 2001. ; and

[12110] Wu, Q.; Zhang, T.; Cheng, J.- F.; Kim, Y.; Grimwood, J.; Schmutz, J.; Dickson, M.; Noonan, J. P.; Zhang, M. Q.; Myers, R. M.; Maniatis, T. : Comparative DNA sequence analysis of mouse a.

[12111] Further studies establishing the function and utilities of PCDHB9 are found in John Hopkins OMIM database record ID 606335, and in cited publications listed in Table 5, which are hereby incorporated by reference.Phosphodiesterase 4c, camp-specific (phosphodiesterase e1 dunce homolog, drosophila) (PDE4C, Accession NM_000923.1) is another GAM72 target gene, herein designated TARGET GENE. PDE4C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDE4C, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDE4C BINDING SITE, designated SEQ ID:16348, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12112] Another function of GAM72 is therefore inhibition of Phosphodiesterase 4c, camp-specific (phosphodiesterase e1 dunce homolog, drosophila) (PDE4C, Accession NM_000923.1), a gene which is a cAMP- specific phosphodiesterase and may be a protein involved in learning and memory. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4C.

[12113] The function of PDE4C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM65.1.Piwi-like 2 (drosophila) (PIWIL2, Accession NM_018068.2) is another GAM72 target gene, herein designated TARGET GENE. PIWIL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PIWIL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of PIWIL2 BINDING SITE, designated SEQ ID:6875, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12114] Another function of GAM72 is therefore inhibition of Piwi-like 2 (drosophila) (PIWIL2, Accession NM_018068.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIWIL2.

[12115] Phospholipase a2, group iid (PLA2G2D, Accession NM_012400.2) is another GAM72 target gene, herein designated TARGET GENE. PLA2G2D BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLA2G2D, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PLA2G2D BINDING SITE, designated SEQ ID:4938, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12116] Another function of GAM72 is therefore inhibition of Phospholipase a2, group iid (PLA2G2D, Accession NM_012400.2), a gene which is involved in phospholipid digestion, remodeling of cell membranes, and host de-

fense, as well as pathophysiologic processes. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G2D.

[12117] The function of PLA2G2D has been established by previous studies. Phospholipase A2 (PLA2) family members (e.g., PLA2G2A; 172411) are lipolytic enzymes that hydrolyze the sn- 2 fatty acid ester bond of glycerophospholipids to produce free fatty acid and lysophospholipids. PLA2s are involved in phospholipid digestion, remodeling of cell membranes, and host defense, as well as pathophysiologic processes involving the production prostaglandins, leukotrienes, thromboxanes, and platelet-activating factor. By searching an EST database using the catalytically essential residues of secretory PLA2s as the probe, followed by PCR of mouse and human spleen cDNA, Ishizaki et al. (1999) obtained cDNAs encoding mouse and human PLA2G2D. Sequence analysis predicted that the 145- amino acid human secretory protein, 48% identical PLA2G2A, contains a 20- residue signal peptide, a potential N- linked glycosylation site, 14 cys residues, and conserved his48 and asp49 sites. Analysis of enzymatic activity detected most activity in culture supernatant

and determined that PLA2G2D preferentially hydrolyzes phosphatidylglycerol and phosphatidylethanolamine, followed by phosphatidylcholine, but does not hydrolyze phosphatidylserine or phosphatidic acid. Northern blot analysis revealed variable expression of 2.0- and 1.0- kb transcripts, with highest expression in pancreas and spleen. In a rat model, expression in thymus increased dramatically after lipopolysaccharide injection. By subtractive cDNA cloning using spleens from wildtype and tumor necrosis factor (Tnf; 191160)/lymphotoxin- alpha (Lta; 153440) double- knockout mice, followed by probing a spleen cDNA library, Shakhov et al. (2000) isolated a cDNA encoding mouse Pla2g2d, which they designated Splash (secretory- type PLA, stroma- associated homolog). Splash was expressed 6- fold less in mutant than wildtype mice. By screening a human cDNA library, they isolated cDNAs encoding human PLA2G2D. Shakhov et al. (2000) noted that the human and mouse protein sequences are 73% identical and 81% homologous. Northern blot analysis detected mouse Pla2g2d expression in adult but not embryonic spleen. By radiation hybrid mapping, Ishizaki et al. (1999) mapped the PLA2G2D gene to 1p36.12. Also using radiation hybrid analysis, Shakhov et

al. (2000) mapped the PLA2G2D gene to 1p36.1- p35, near the PLA2G2A gene and a region known for frequent loss of heterozygosity in human tumors. Shakhov et al. (2000) mapped the mouse gene to chromosome 4.

[12118]

[12119] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12120] Ishizaki, J.; Suzuki, N.; Higashino, K.; Yokota, Y.; Ono, T.; Kawamoto, K.; Fujii, N.; Arita, H.; Hanasaki, K. : Cloning and characterization of novel mouse and human secretory phospholipase A(2)s. J. Biol. Chem. 274: 24973- 24979, 1999. ; and

[12121] Shakhov, A. N.; Rubtsov, A. V.; Lyakhov, I. G.; Tumanov, A. V.; Nedospasov, S. A. : SPLASH (PLA(2)IID), a novel member of phospholipase A2 family, is associated with lymphotoxin- defici.

[12122] Further studies establishing the function and utilities of PLA2G2D are found in John Hopkins OMIM database record ID 605630, and in cited publications listed in Table 5, which are hereby incorporated by reference.Polymerase (dna directed), eta (POLH, Accession NM_006502.1) is another GAM72 target gene, herein designated TARGET

GENE. POLH BINDING SITE1 and POLH BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by POLH, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POLH BINDING SITE1 and POLH BINDING SITE2, designated SEQ ID:19397 and SEQ ID:12030 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12123] Another function of GAM72 is therefore inhibition of Polymerase (dna directed), eta (POLH, Accession NM_006502.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLH.

[12124] Polymerase (dna directed) kappa (POLK, Accession NM_016218.1) is another GAM72 target gene, herein designated TARGET GENE. POLK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by POLK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POLK BINDING SITE, designated

SEQ ID:6167, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12125] Another function of GAM72 is therefore inhibition of Polymerase (dna directed) kappa (POLK, Accession NM_016218.1), a gene which is necessary for chromosome segregation. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLK.

[12126] The function of POLK has been established by previous studies. Wang et al. (2000) found that yeast TRF4, an evolutionarily conserved gene necessary for chromosome segregation, encodes a DNA polymerase with beta- polymerase- like properties. A double mutant in the redundant homologs TRF4 and TRF5 is unable to complete S phase, whereas a TRF4 single mutant completes a presumably defective S phase that results in the failure of cohesion between the replicated sister chromatids. This suggested that TRFs are a key link in the coordination between DNA replication and sister chromatid cohesion. Walowsky et al. (1999) noted that a region of the human TRF4- 1 gene is identical to an STS (OMIM Ref. No. G06245) mapping to 5p15. This region of chromosome 5p is among the most common regions amplified in small

cell lung tumor cell lines and in primary small cell tumors. In addition, amplifications in this region are frequently found in high- grade ovarian tumors.

[12127]

[12128] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12129] Wang, Z.; Castano, I. B.; De Las Penas, A.; Adams, C.; Christman, M. F. : Pol kappa: a DNA polymerase required for sister chromatid cohesion. Science 289: 774- 779, 2000. ; and

[12130] Walowsky, C.; Fitzhugh, D. J.; Castano, I. B.; Ju, J. Y.; Levin, N. A.; Christman, M. F. : The topoisomerase- related function gene TRF4 affects cellular sensitivity to the antitumor agent.

[12131] Further studies establishing the function and utilities of POLK are found in John Hopkins OMIM database record ID 605198, and in cited publications listed in Table 5, which are hereby incorporated by reference.PP591 (Accession NM_025207.2) is another GAM72 target gene, herein designated TARGET GENE. PP591 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PP591, corresponding to a target binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PP591 BINDING SITE, designated SEQ ID:5542, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12132] Another function of GAM72 is therefore inhibition of PP591 (Accession NM_025207.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP591.

[12133] Protein phosphatase 1, regulatory (inhibitor) subunit 3b (PPP1R3B, Accession NM_024607.1) is another GAM72 target gene, herein designated TARGET GENE. PPP1R3B BINDING SITE1 and PPP1R3B BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PPP1R3B, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP1R3B BINDING SITE1 and PPP1R3B BINDING SITE2, designated SEQ ID:12619 and SEQ ID:9817 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12134] Another function of GAM72 is therefore inhibition of Pro-

tein phosphatase 1, regulatory (inhibitor) subunit 3b (PPP1R3B, Accession NM_024607.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R3B.

[12135] PRIC285 (Accession NM_033405.1) is another GAM72 target gene, herein designated TARGET GENE. PRIC285 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRIC285, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRIC285 BINDING SITE, designated SEQ ID:17244, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12136] Another function of GAM72 is therefore inhibition of PRIC285 (Accession NM_033405.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRIC285.

[12137] Protein kinase, y-linked (PRKY, Accession NM_002760.1) is another GAM72 target gene, herein designated TARGET GENE. PRKY BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKY, corresponding to a target binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRKY BINDING SITE, designated SEQ ID:4590, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12138] Another function of GAM72 is therefore inhibition of Protein kinase, y-linked (PRKY, Accession NM_002760.1), a gene which is a putative protein kinase. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKY.

[12139] The function of PRKY has been established by previous studies. PRKX (OMIM Ref. No. 300083) is a novel serine/threonine subtype of protein kinase that appears to encode a protein related to the catalytic subunit of the cAMP- dependent protein kinases, which are key players in the cellular responses to the second messenger cAMP. Klink et al. (1995) found that somatic cell hybrid analysis of PRKX under high stringency conditions revealed at least 3 further loci closely related to this gene in the human, constituting a small subfamily. Schiebel et al. (1997) isolated and characterized the PRKY gene, which is highly homologous to the PRKX gene on Xp22.3 and represents a

member of the cAMP- dependent serine/threonine protein kinase gene family. Abnormal interchange can occur anywhere between Xp and Yp proximal to SRY (OMIM Ref. No. 480000). Schiebel et al. (1997) demonstrated that abnormal interchange in XX males (OMIM Ref. No. 278850) and XY females (OMIM Ref. No. 306100) happens particularly frequently between PRKX and PRKY. In a collection of 26 XX males and 4 XY females, between 27 and 35% of the interchanges took place between PRK homologs, but at different sites within the gene. PRKY and PRKX are located far from the pseudoautosomal region, where XY exchange normally takes place. Schiebel et al. (1997) stated that the unprecedented high sequence identity and identical orientation of PRKY to its homologous partner on the X chromosome, PRKX, explains the high frequency of abnormal pairing and the subsequent ectopic recombination, leading to XX males and XY females and to the highest rate of recombination outside the pseudoautosomal region. Schiebel et al. (1997) used FISH analysis to map the PRKY gene to Yp11.2 in close proximity to AMELY (OMIM Ref. No. 410000); the autosomal copy, a pseudogene (OMIM Ref. No. PRKXP1), to 15q26; and a further X- linked pseudogene (OMIM Ref. No. PRKXP2) to Xq12- q13.

[12140]

[12141] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12142] Schiebel, K.; Mertz, A.; Winkelmann, B.; Glaser, B.; Schempp, W.; Rappold, G. : FISH localization of the human Y- homolog of protein kinase PRKX (PRKY) to Yp11.2 and two pseudogenes to 15q26 and Xq12- q13. Cytogenet. Cell Genet. 76: 49- 52, 1997. ; and

[12143] Schiebel, K.; Winkelmann, M.; Mertz, A.; Xu, X.; Page, D. C.; Weil, D.; Petit, C.; Rappold, G. A. : Abnormal XY inter- change between a novel isolated protein kinase gene, PRKY, and its h.

[12144] Further studies establishing the function and utilities of PRKY are found in John Hopkins OMIM database record ID 400008, and in cited publications listed in Table 5, which are hereby incorporated by reference.PRO0038 (Accession NM_014113.1) is another GAM72 target gene, herein des- ignated TARGET GENE. PRO0038 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO0038, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of

the nucleotide sequences of PRO0038 BINDING SITE, designated SEQ ID:3005, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12145] Another function of GAM72 is therefore inhibition of PRO0038 (Accession NM_014113.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0038.

[12146] PRO0255 (Accession NM_014124.1) is another GAM72 target gene, herein designated TARGET GENE. PRO0255 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO0255, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0255 BINDING SITE, designated SEQ ID:7528, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12147] Another function of GAM72 is therefore inhibition of PRO0255 (Accession NM_014124.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0255.

[12148] PRO0456 (Accession NM_014127.1) is another GAM72

target gene, herein designated TARGET GENE. PRO0456 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO0456, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0456 BINDING SITE, designated SEQ ID:19460, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12149] Another function of GAM72 is therefore inhibition of PRO0456 (Accession NM_014127.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0456.

[12150] PRO0478 (Accession NM_014129.1) is another GAM72 target gene, herein designated TARGET GENE. PRO0478 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO0478, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0478 BINDING SITE, designated SEQ ID:16168, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12151] Another function of GAM72 is therefore inhibition of PRO0478 (Accession NM_014129.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0478.

[12152] PRO0628 (Accession NM_014134.1) is another GAM72 target gene, herein designated TARGET GENE. PRO0628 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO0628, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0628 BINDING SITE, designated SEQ ID:15616, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12153] Another function of GAM72 is therefore inhibition of PRO0628 (Accession NM_014134.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0628.

[12154] PRO1048 (Accession NM_018497.1) is another GAM72 target gene, herein designated TARGET GENE. PRO1048 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRO1048, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO1048 BINDING SITE, designated SEQ ID:18804, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12155] Another function of GAM72 is therefore inhibition of PRO1048 (Accession NM_018497.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1048.

[12156] PRO1777 (Accession) is another GAM72 target gene, herein designated TARGET GENE. PRO1777 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO1777, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO1777 BINDING SITE, designated SEQ ID:16858, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12157] Another function of GAM72 is therefore inhibition of PRO1777 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1777.

[12158] PRO2015 (Accession NM_018512.1) is another GAM72 target gene, herein designated TARGET GENE. PRO2015 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRO2015, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO2015 BINDING SITE, designated SEQ ID:11837, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12159] Another function of GAM72 is therefore inhibition of PRO2015 (Accession NM_018512.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2015.

[12160] PRO2893 (Accession) is another GAM72 target gene, herein designated TARGET GENE. PRO2893 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRO2893, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO2893 BINDING SITE, designated SEQ ID:4610, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA,

also designated SEQ ID:342.

[12161] Another function of GAM72 is therefore inhibition of PRO2893 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2893.

[12162] Pleckstrin and sec7 domain protein (PSD, Accession NM_002779.2) is another GAM72 target gene, herein designated TARGET GENE. PSD BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PSD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PSD BINDING SITE, designated SEQ ID:14038, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12163] Another function of GAM72 is therefore inhibition of Pleckstrin and sec7 domain protein (PSD, Accession NM_002779.2), a gene which promotes guanine- nucleotide exchange on arf6. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSD.

[12164] The function of PSD has been established by previous studies. Perletti et al. (1997) identified a novel human

gene on 10q24, contiguous to the 3- prime end of the NFKB2 gene (OMIM Ref. No. 164012) in a tail- to- tail arrangement. They described a cDNA of 4,307 bp, isolated from an adult human brain cDNA library, which contains an open reading frame encoding a putative protein of 645 amino acids with a predicted molecular weight of 71 kD. Database homology searches indicated that the novel gene codes for a putative protein containing 2 discrete domains with significant homology to the Sec7 and pleckstrin- homology (PH) domains, respectively. They used the gene symbol PSD for 'pleckstrin- Sec7 domains.' Northern blot analysis of a panel of RNAs from normal human tissues using the PSD cDNA as probe revealed the presence of 3 different tissue- specific transcripts of approximately 4.3, 2.3, and 1.8 kb, the longest of which was expressed only in brain. The data suggested that the PSD gene may encode a protein related to the protein family containing both the Sec7 in the PH domains and thought to be involved in signaling transduction processes. Other human proteins in the same family include cytohesin- 1 (Kolanus et al., 1996) and ARNO (OMIM Ref. No. 602488) (Chardin et al., 1996).

[12165]

[12166] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12167] Kolanus, W.; Nagel, W.; Schiller, B.; Zeitlmann, L.; Godar, S.; Stockinger, H.; Seed, B. : Alpha- L- beta- 2 integrin/ LFA- 1 binding to ICAM- 1 induced by cytohesin- 1, a cytoplasmic regulatory molecule. Cell 86: 233- 242, 1996. ; and

[12168] Perletti, L.; Talarico, D.; Trecca, D.; Ronchetti, D.; Fracchiolla, N. S.; Maiolo, A. T.; Neri, A. : Identification of a novel gene, PSD, adjacent to NFKB2/lyt- 10, which contains Sec7 an.

[12169] Further studies establishing the function and utilities of PSD are found in John Hopkins OMIM database record ID 602327, and in cited publications listed in Table 5, which are hereby incorporated by reference.Polymerase i and transcript release factor (PTRF, Accession NM_012232.1) is another GAM72 target gene, herein designated TARGET GENE. PTRF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PTRF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of PTRF BINDING SITE, designated SEQ ID:12748, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12170] Another function of GAM72 is therefore inhibition of Polymerase i and transcript release factor (PTRF, Accession NM_012232.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTRF.

[12171] RAD18 (Accession NM_020165.2) is another GAM72 target gene, herein designated TARGET GENE. RAD18 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAD18, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAD18 BINDING SITE, designated SEQ ID:923, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12172] Another function of GAM72 is therefore inhibition of RAD18 (Accession NM_020165.2), a gene which functions with dna repair protein rad5 in error- free postreplication dna repair and therefore may be associated with Cancer. Accordingly, utilities of GAM72 include diagnosis, preven-

tion and treatment of Cancer, and of other diseases and clinical conditions associated with RAD18.

[12173] The function of RAD18 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.2.Rad51 homolog (reca homolog, e. coli) (s. cerevisiae) (RAD51, Accession NM_002875.2) is another GAM72 target gene, herein designated TARGET GENE. RAD51 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RAD51, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAD51 BINDING SITE, designated SEQ ID:11450, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12174] Another function of GAM72 is therefore inhibition of Rad51 homolog (reca homolog, e. coli) (s. cerevisiae) (RAD51, Accession NM_002875.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD51.

[12175] Rad51-like 1 (s. cerevisiae) (RAD51L1, Accession NM_133509.1) is another GAM72 target gene, herein des-

ignated TARGET GENE. RAD51L1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by RAD51L1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAD51L1 BINDING SITE, designated SEQ ID:19291, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12176] Another function of GAM72 is therefore inhibition of Rad51-like 1 (s. cerevisiae) (RAD51L1, Accession NM_133509.1), a gene which is a member of the RAD51 family of strand- transfer proteins. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD51L1.

[12177] The function of RAD51L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.2.Retinoblastoma binding protein 9 (RBBP9, Accession NM_006606.2) is another GAM72 target gene, herein designated TARGET GENE. RBBP9 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RBBP9, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBBP9 BINDING SITE, designated SEQ ID:12889, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12178] Another function of GAM72 is therefore inhibition of Retinoblastoma binding protein 9 (RBBP9, Accession NM_006606.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP9.

[12179] Retinoblastoma-like 1 (p107) (RBL1, Accession NM_002895.1) is another GAM72 target gene, herein designated TARGET GENE. RBL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RBL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RBL1 BINDING SITE, designated SEQ ID:3943, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12180] Another function of GAM72 is therefore inhibition of Retinoblastoma-like 1 (p107) (RBL1, Accession

NM_002895.1), a gene which has an important role in negatively regulating the rate of progression of the cell cycle. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBL1.

[12181] The function of RBL1 has been established by previous studies. The cellular protein p107, like the retinoblastoma gene product (OMIM Ref. No. 180200), has been shown to form a specific complex with adenovirus E1A and SV40 large T antigen (T). The binding characteristics implied that RB1 and p107 share a common biochemical function. Ewen et al. (1991) used a partial cDNA for human p107 to map the gene to 20q11.2 by fluorescence in situ hybridization. The cDNA encoded a 936- residue protein. Comparison with RB1 showed a major region of homology extending over 564 residues. This region in RB1 is essential to its growth- controlling function. Sequences outside of this region are largely unique to each protein.

[12182] Animal model experiments lend further support to the function of RBL1. LeCouter et al. (1998) introduced a null mutation in p107 into the germ line of mice and bred into a BALB/cJ genetic background. Mice lacking p107 were viable and fertile but displayed impaired growth, reaching

about 50% of normal weight by 21 days of age. Mutant mice exhibited a myeloproliferative disorder characterized by ectopic myeloid hyperplasia in the spleen and liver. Embryonic p107 - /- fibroblasts and primary myoblasts isolated from adult p107 - /- mice displayed a striking 2-fold acceleration in doubling time. However, cell sort analysis indicated that the fraction of cells in G1, S, and G2 was unaltered, suggesting that the different phases of the cell cycle in p107 - /- cells was uniformly reduced by a factor of 2. Western analysis of cyclin expression in synchronized p107 - /- fibroblasts revealed that expression of cyclins E and A preceded that of D1. Mutant embryos expressed approximately twice the normal levels of Rb, whereas p130 levels were unaltered. Finally, mutant mice reverted to a wildtype phenotype following a single backcross with C57BL/6J mice, suggesting the existence of modifier genes that have potentially epistatic relationships with p107. LeCouter et al. (1998) concluded that p107 has an important role in negatively regulating the rate of progression of the cell cycle, but in a strain- dependent manner.

[12183] It is appreciated that the abovementioned animal model for RBL1 is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[12184] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12185] Ewen, M. E.; Xing, Y.; Lawrence, J. B.; Livingston, D. M. : Molecular cloning, chromosomal mapping, and expression of the cDNA for p107, a retinoblastoma gene product- related protein. Cell 66: 1155- 1164, 1991. ; and

[12186] LeCouter, J. E.; Kablar, B.; Hardy, W. R.; Ying, C.; Megeney, L. A.; May, L. L.; Rudnicki, M. A. : Strain- dependent myeloid hyperplasia, growth deficiency, and accelerated cell cycle in.

[12187] Further studies establishing the function and utilities of RBL1 are found in John Hopkins OMIM database record ID 116957, and in cited publications listed in Table 5, which are hereby incorporated by reference.Recq protein-like 5 (RECQL5, Accession NM_004259.2) is another GAM72 target gene, herein designated TARGET GENE. RECQL5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RECQL5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of RECQL5 BINDING SITE, designated SEQ ID:16624, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12188] Another function of GAM72 is therefore inhibition of Recq protein-like 5 (RECQL5, Accession NM_004259.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RECQL5.

[12189] Rho-related btb domain containing 3 (RHOBTB3, Accession NM_014899.1) is another GAM72 target gene, herein designated TARGET GENE. RHOBTB3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RHOBTB3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RHOBTB3 BINDING SITE, designated SEQ ID:14678, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12190] Another function of GAM72 is therefore inhibition of Rho-related btb domain containing 3 (RHOBTB3, Accession NM_014899.1) . Accordingly, utilities of GAM72 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with RHOBTB3.

[12191] RNO2 (Accession) is another GAM72 target gene, herein designated TARGET GENE. RNO2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RNO2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNO2 BINDING SITE, designated SEQ ID:8096, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12192] Another function of GAM72 is therefore inhibition of RNO2 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNO2.

[12193] RoXaN (Accession NM_017590.4) is another GAM72 target gene, herein designated TARGET GENE. RoXaN BINDING SITE1 and RoXaN BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by RoXaN, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RoXaN BINDING SITE1 and RoXaN

BINDING SITE2, designated SEQ ID:7925 and SEQ ID:1449 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12194] Another function of GAM72 is therefore inhibition of RoXaN (Accession NM_017590.4) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RoXaN.

[12195] Ribosomal protein l13 (RPL13, Accession NM_000977.2) is another GAM72 target gene, herein designated TARGET GENE. RPL13 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RPL13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPL13 BINDING SITE, designated SEQ ID:7469, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12196] Another function of GAM72 is therefore inhibition of Ribosomal protein l13 (RPL13, Accession NM_000977.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL13.

[12197] Rpo1-2 (Accession) is another GAM72 target gene, herein designated TARGET GENE. Rpo1-2 BINDING SITE1 and Rpo1-2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by Rpo1-2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of Rpo1-2 BINDING SITE1 and Rpo1-2 BINDING SITE2, designated SEQ ID:1849 and SEQ ID:1072 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12198] Another function of GAM72 is therefore inhibition of Rpo1-2 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rpo1-2.

[12199] RRP4 (Accession NM_014285.3) is another GAM72 target gene, herein designated TARGET GENE. RRP4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RRP4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RRP4 BINDING SITE, designated SEQ ID:15765, to the nucleotide se-

quence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12200] Another function of GAM72 is therefore inhibition of RRP4 (Accession NM_014285.3) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRP4.

[12201] S164 (Accession XM_027330.10) is another GAM72 target gene, herein designated TARGET GENE. S164 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by S164, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of S164 BINDING SITE, designated SEQ ID:19587, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12202] Another function of GAM72 is therefore inhibition of S164 (Accession XM_027330.10) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S164.

[12203] SAC2 (Accession NM_014937.1) is another GAM72 target gene, herein designated TARGET GENE. SAC2 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by SAC2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SAC2 BINDING SITE, designated SEQ ID:9886, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12204] Another function of GAM72 is therefore inhibition of SAC2 (Accession NM_014937.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAC2.

[12205] SCYA5 (Accession) is another GAM72 target gene, herein designated TARGET GENE. SCYA5 BINDING SITE1 and SCYA5 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SCYA5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCYA5 BINDING SITE1 and SCYA5 BINDING SITE2, designated SEQ ID:9538 and SEQ ID:19472 respectively, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12206] Another function of GAM72 is therefore inhibition of

SCYA5 (Accession) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA5.

[12207] Small edrk-rich factor 1b (centromeric) (SERF1B, Accession NM_022978.1) is another GAM72 target gene, herein designated TARGET GENE. SERF1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SERF1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SERF1B BINDING SITE, designated SEQ ID:12529, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12208] Another function of GAM72 is therefore inhibition of Small edrk-rich factor 1b (centromeric) (SERF1B, Accession NM_022978.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERF1B.

[12209] Splicing factor, arginine/serine-rich 2, interacting protein (SFRS2IP, Accession NM_004719.1) is another GAM72 target gene, herein designated TARGET GENE. SFRS2IP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SFRS2IP, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFRS2IP BINDING SITE, designated SEQ ID:6699, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12210] Another function of GAM72 is therefore inhibition of Splicing factor, arginine/serine-rich 2, interacting protein (SFRS2IP, Accession NM_004719.1), a gene which plays an essential role in pre- mRNA splicing. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS2IP.

[12211] The function of SFRS2IP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Serum/glucocorticoid regulated kinase-like (SGKL, Accession NM_013257.3) is another GAM72 target gene, herein designated TARGET GENE. SGKL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SGKL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of SGKL BINDING SITE, designated SEQ ID:5761, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12212] Another function of GAM72 is therefore inhibition of Serum/glucocorticoid regulated kinase-like (SGKL, Accession NM_013257.3) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGKL.

[12213] Sh2 domain containing 3a (SH2D3A, Accession NM_005490.1) is another GAM72 target gene, herein designated TARGET GENE. SH2D3A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SH2D3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SH2D3A BINDING SITE, designated SEQ ID:15487, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12214] Another function of GAM72 is therefore inhibition of Sh2 domain containing 3a (SH2D3A, Accession NM_005490.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with SH2D3A.

[12215] Sialyltransferase 4a (beta-galactoside alpha-2,3-sialytransferase) (SIAT4A, Accession NM_173344.1) is another GAM72 target gene, herein designated TARGET GENE. SIAT4A BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT4A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT4A BINDING SITE, designated SEQ ID:9442, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12216] Another function of GAM72 is therefore inhibition of Sialyltransferase 4a (beta-galactoside alpha-2,3-sialytransferase) (SIAT4A, Accession NM_173344.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT4A.

[12217] Sialic acid binding ig-like lectin 11 (SIGLEC11, Accession NM_052884.1) is another GAM72 target gene, herein designated TARGET GENE. SIGLEC11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by SIGLEC11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIGLEC11 BINDING SITE, designated SEQ ID:5392, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12218] Another function of GAM72 is therefore inhibition of Sialic acid binding ig-like lectin 11 (SIGLEC11, Accession NM_052884.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIGLEC11.

[12219] Solute carrier family 2 (facilitated glucose transporter), member 11 (SLC2A11, Accession NM_030807.2) is another GAM72 target gene, herein designated TARGET GENE. SLC2A11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC2A11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC2A11 BINDING SITE, designated SEQ ID:14546, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12220] Another function of GAM72 is therefore inhibition of Solute carrier family 2 (facilitated glucose transporter), member 11 (SLC2A11, Accession NM_030807.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A11.

[12221] SMA3 (Accession NM_006780.1) is another GAM72 target gene, herein designated TARGET GENE. SMA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SMA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMA3 BINDING SITE, designated SEQ ID:5456, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12222] Another function of GAM72 is therefore inhibition of SMA3 (Accession NM_006780.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMA3.

[12223] Smith-magenis syndrome chromosome region, candidate 5 (SMCR5, Accession NM_144774.1) is another GAM72 target gene, herein designated TARGET GENE. SMCR5

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SMCR5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMCR5 BINDING SITE, designated SEQ ID:10816, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12224] Another function of GAM72 is therefore inhibition of Smith-magenis syndrome chromosome region, candidate 5 (SMCR5, Accession NM_144774.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCR5.

[12225] Small nuclear rna activating complex, polypeptide 1, 43kda (SNAPC1, Accession NM_003082.2) is another GAM72 target gene, herein designated TARGET GENE. SNAPC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNAPC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNAPC1 BINDING SITE, designated SEQ ID:6354, to the nucleotide sequence of GAM72 RNA, herein designated

GAM RNA, also designated SEQ ID:342.

[12226] Another function of GAM72 is therefore inhibition of Small nuclear rna activating complex, polypeptide 1, 43kda (SNAPC1, Accession NM_003082.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAPC1.

[12227] Sprouty homolog 4 (drosophila) (SPRY4, Accession NM_030964.2) is another GAM72 target gene, herein designated TARGET GENE. SPRY4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPRY4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPRY4 BINDING SITE, designated SEQ ID:10205, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12228] Another function of GAM72 is therefore inhibition of Sprouty homolog 4 (drosophila) (SPRY4, Accession NM_030964.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRY4.

[12229] SRGAP1 (Accession XM_051143.3) is another GAM72 target gene, herein designated TARGET GENE. SRGAP1 BIND-

ING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SRGAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SRGAP1 BINDING SITE, designated SEQ ID:18079, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12230] Another function of GAM72 is therefore inhibition of SRGAP1 (Accession XM_051143.3) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRGAP1.

[12231] Syntaxin 12 (STX12, Accession NM_177424.1) is another GAM72 target gene, herein designated TARGET GENE. STX12 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STX12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STX12 BINDING SITE, designated SEQ ID:2278, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12232] Another function of GAM72 is therefore inhibition of Syn-

taxin 12 (STX12, Accession NM_177424.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX12.

[12233] Sudd suppressor of bimd6 homolog (a. nidulans) (SUDD, Accession NM_145906.1) is another GAM72 target gene, herein designated TARGET GENE. SUDD BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SUDD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SUDD BINDING SITE, designated SEQ ID:13818, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12234] Another function of GAM72 is therefore inhibition of Sudd suppressor of bimd6 homolog (a. nidulans) (SUDD, Accession NM_145906.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUDD.

[12235] Reserved (SYAP1, Accession NM_032796.2) is another GAM72 target gene, herein designated TARGET GENE. SYAP1 BINDING SITE is a target binding site found in the

3` untranslated region of mRNA encoded by SYAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYAP1 BINDING SITE, designated SEQ ID:19134, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12236] Another function of GAM72 is therefore inhibition of Reserved (SYAP1, Accession NM_032796.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYAP1.

[12237] Synaptojanin 2 binding protein (SYNJ2BP, Accession NM_018373.1) is another GAM72 target gene, herein designated TARGET GENE. SYNJ2BP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SYNJ2BP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYNJ2BP BINDING SITE, designated SEQ ID:7272, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12238] Another function of GAM72 is therefore inhibition of Synaptojanin 2 binding protein (SYNJ2BP, Accession NM_018373.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNJ2BP.

[12239] Synaptopodin 2 (SYNPO2, Accession XM_050219.6) is another GAM72 target gene, herein designated TARGET GENE. SYNPO2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SYNPO2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYNPO2 BINDING SITE, designated SEQ ID:9657, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12240] Another function of GAM72 is therefore inhibition of Synaptopodin 2 (SYNPO2, Accession XM_050219.6) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNPO2.

[12241] T-box 6 (TBX6, Accession NM_004608.2) is another GAM72 target gene, herein designated TARGET GENE. TBX6 BINDING SITE is a target binding site found in the 3`

untranslated region of multiple transcripts of mRNA encoded by TBX6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TBX6 BINDING SITE, designated SEQ ID:7788, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12242] Another function of GAM72 is therefore inhibition of T-box 6 (TBX6, Accession NM_004608.2), a gene which is a probable transcriptional regulator involved in developmental processes. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX6.

[12243] The function of TBX6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM59.1.Thymine-dna glycosylase (TDG, Accession NM_003211.1) is another GAM72 target gene, herein designated TARGET GENE. TDG BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TDG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of TDG BINDING SITE, designated SEQ ID:16585, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12244] Another function of GAM72 is therefore inhibition of Thymine-dna glycosylase (TDG, Accession NM_003211.1), a gene which excises uracil and thymine from mispairs with guanidine. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TDG.

[12245] The function of TDG has been established by previous studies. The process of spontaneous hydrolytic deamination affects all DNA bases with exocyclic amino groups (Lindahl, 1982). Hydrolytic deamination of 5- methylcytosine leads to the formation of G/T mismatches. These G/T mismatches are corrected to G/C basepairs by a mismatch- specific DNA- binding glycosylase, TDG. TDG initiates repair of G/T and G/U mismatches, commonly associated with CpG islands, by removing thymine and uracil moieties. Tini et al. (2002) reported that TDG associates with transcriptional coactivators CBP (OMIM Ref. No. 600140) and p300 (OMIM Ref. No. 602700) and that the resulting complexes are competent for both the excision step of repair and histone acetylation. TDG stimulated CBP

transcriptional activity in transfected cells and reciprocally served as a substrate for CBP/p300 acetylation. This acetylation triggered release of CBP from DNA ternary complexes and also regulated recruitment of repair endonuclease APE (OMIM Ref. No. 107748). These observations revealed a potential regulatory role for protein acetylation in base mismatch repair and a role for CBP/p300 in maintaining genomic stability.

[12246]

[12247] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12248] Tini, M.; Benecke, A.; Um, S.- J.; Torchia, J.; Evans, R. M.; Chambon, P. : Association of CBP/p300 acetylase and thymine DNA glycosylase links DNA repair and transcription. Molec. Cell 9: 265- 277, 2002. ; and

[12249] Neddermann, P.; Gallinari, P.; Lettieri, T.; Schmid, D.; Truong, O.; Hsuan, J. J.; Wiebauer, K.; Jiricny, J. : Cloning and expression of human G/T mismatch- specific thymine- DNA glycosyl.

[12250] Further studies establishing the function and utilities of TDG are found in John Hopkins OMIM database record ID 601423, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tyrosyl-dna phosphodiesterase 1 (TDP1, Accession NM_018319.2) is another GAM72 target gene, herein designated TARGET GENE. TDP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TDP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TDP1 BINDING SITE, designated SEQ ID:3718, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12251] Another function of GAM72 is therefore inhibition of Tyrosyl-dna phosphodiesterase 1 (TDP1, Accession NM_018319.2) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TDP1.

[12252] Telomerase-associated protein 1 (TEP1, Accession NM_007110.3) is another GAM72 target gene, herein designated TARGET GENE. TEP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TEP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TEP1 BINDING SITE, designated SEQ ID:7532, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12253] Another function of GAM72 is therefore inhibition of Telomerase-associated protein 1 (TEP1, Accession NM_007110.3), a gene which interacts with active telomerase RNA. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEP1.

[12254] The function of TEP1 has been established by previous studies. The telomerase ribonucleoprotein (OMIM Ref. No. 187270) catalyzes the addition of new telomeres on the chromosome ends. Harrington et al. (1997) noted that in humans, the telomeric repeat is 5- prime- TTAGGG- 3- prime and the telomerase RNA contains a sequence complementary to this telomeric repeat. The telomerase RNA

template is required for telomere repeat synthesis in vitro and in vivo. The ribonucleoprotein complex responsible for telomerase activity had been purified only in ciliates. Purified tetrahymena telomerase contains an RNA and 2 protein components, p80 and p95. The p80 component can be specifically cross linked to telomerase RNA, whereas the p95 component binds and cross links to sin- gle- stranded, telomeric DNA. Harrington et al. (1997) identified a cDNA encoding a tetrahymena p80 homolog from a murine colonic crypt expressed sequence tag (EST) database. The mouse sequence was used as a probe to identify contiguous human cDNA clones from a library prepared from a human colon carcinoma cell line. The mouse and human open reading frames were found to be 75% identical at the amino acid level. The predicted hu- man polypeptide contains 2,627 amino acids, 2 fewer than the predicted mouse polypeptide. Northern blot analysis of both mouse and human tissues showed widespread expression of the gene, which they symbol- ized TP1. The studies indicated that telomerase- associ- ated proteins are conserved from ciliates to humans. Saito et al. (1997) mapped the human TEP1 gene and mouse Tep1 gene by fluorescence in situ hybridization to human

chromosome 14q11.2 and to the C2- D1 band of mouse chromosome 14, respectively. By means of genetic linkage mapping, the mouse gene was further localized to a position 2.7 cM distal to D14Mit18 and D14Mit134, and 2.0 cM proximal to D14Mit5 on mouse chromosome 14, where conserved linkage homology with human chromosome 14q11- q12 had been identified.

[12255]

[12256] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12258] Saito, T.; Matsuda, Y.; Suzuki, T.; Hayashi, A.; Yuan, X.; Saito, M.; Nakayama, J.; Hori, T.; Ishikawa, F. : Comparative gene mapping of the human and mouse TEP1 genes, which encode one.

[12259] Further studies establishing the function and utilities of TEP1 are found in John Hopkins OMIM database record ID 601686, and in cited publications listed in Table 5, which are hereby incorporated by reference.Testis derived tran-

script (3 lim domains) (TES, Accession NM_015641.2) is another GAM72 target gene, herein designated TARGET GENE. TES BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TES, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TES BINDING SITE, designated SEQ ID:12134, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12260] Another function of GAM72 is therefore inhibition of Testis derived transcript (3 lim domains) (TES, Accession NM_015641.2), a gene which acts as a tumor suppressor and therefore may be associated with Ovarian carcinomas, breast cancer. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Ovarian carcinomas, breast cancer, and of other diseases and clinical conditions associated with TES.

[12261] The function of TES has been established by previous studies. By construction and sequencing of a BAC contig within the FRA7G region at 7q31.2, Tatarelli et al. (2000) identified a novel gene which they called TESTIN because of its homology to mouse testin. They isolated 3 human

isoforms. Isoforms 1 and 2, which use exon 1a and differ in their 3- prime UTR, contain 7 exons and encode a deduced 421- amino acid protein with a calculated molecular mass of 48 kD. Isoform 3, which uses exon 1b, encodes a deduced 412- amino acid protein with a calculated molecular mass of 47 kD. Each of the isoforms contains 3 LIM domains in the C terminus and shows 89% and 35% sequence identity with the mouse and C. elegans homologs, respectively. Human TESTIN contains 7 putative functional sites: 4 phosphorylation sites, a glycosylation site, a myristylation site, and a cytochrome C heme- binding site. Northern blot analysis of normal human tissues demonstrated ubiquitous expression of an approximately 2.8- kb TESTIN transcript, which apparently corresponded to isoforms 2 and 3. An approximately 1.5- kb transcript, corresponding to isoform 1, was expressed at significantly higher levels in testis than in other tissues. FRA7G is a common aphidicolin- inducible fragile site at 7q31.2 showing loss of heterozygosity in human malignancies. Tatarelli et al. (2000) noted that a relationship between LIM proteins and cancer had been observed in several studies. By RT- PCR analysis, they found lack of TESTIN expression in 22% of cancer cell lines and 44% of the cell

lines derived from hematologic malignancies. They determined that in most of these cases the inactivation of TESTIN expression was due to methylation of a CpG island. Analysis of the TESTIN coding region in 26 tumor cell lines revealed 3 missense mutations. The authors thus suggested that TESTIN may represent a tumor suppressor gene. Tobias et al. (2001) also cloned and characterized human TESTIN, which they called TES. Mutation analysis of the coding TES exons in 21 human- derived cell lines revealed the presence of a frameshift mutation in 1 allele in a breast cancer cell line. Methylation of the CpG island at the 5- prime end of TES appeared to be a remarkably frequent finding, occurring in 7 of 10 ovarian carcinomas and in each of 30 tumor- derived cell lines tested. Moreover, forced expression of TES in HeLa or OVCAR5 cells resulted in a profound reduction in growth potential, as determined by the colony formation assay. Tobias et al. (2001) suggested that TES is a tumor suppressor gene that is inactivated primarily by transcriptional silencing resulting from CpG island methylation.

[12262]

[12263] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[12264] Tatarelli, C.; Linnenbach, A.; Mimori, K.; Croce, C. M. : Characterization of the human TESTIN gene localized in the FRA7G region at 7q31.2. Genomics 68: 1- 12, 2000. ; and

[12265] Tobias, E. S.; Hurlstone, A. F. L.; MacKenzie, E.; McFarlane, R.; Black, D. M. : The TES gene at 7q31.1 is methylated in tumours and encodes a novel growth- suppressing LIM domain prote.

[12266] Further studies establishing the function and utilities of TES are found in John Hopkins OMIM database record ID 606085, and in cited publications listed in Table 5, which are hereby incorporated by reference.TM7SF3 (Accession NM_016551.1) is another GAM72 target gene, herein designated TARGET GENE. TM7SF3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TM7SF3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TM7SF3 BINDING SITE, designated SEQ ID:572, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12267] Another function of GAM72 is therefore inhibition of TM7SF3 (Accession NM_016551.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM7SF3.

[12268] Tumor necrosis factor receptor superfamily, member 1b (TNFRSF1B, Accession NM_001066.2) is another GAM72 target gene, herein designated TARGET GENE. TNFRSF1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFRSF1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFRSF1B BINDING SITE, designated SEQ ID:6162, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12269] Another function of GAM72 is therefore inhibition of Tumor necrosis factor receptor superfamily, member 1b (TNFRSF1B, Accession NM_001066.2), a gene which mediates proinflammatory cellular responses. and therefore may be associated with Familial combined hyperlipidemia. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Familial combined hyperlipidemia., and of other diseases and clinical conditions associated

with TNFRSF1B.

[12270] The function of TNFRSF1B has been established by previous studies. Preassembly or self- association of cytokine receptor dimers (e.g., OMIM Ref. No. 147810; IL2R, 147730; and EPOR, 133171) occurs via the same amino acid contacts that are critical for ligand binding. Chan et al. (2000) found that, in contrast, the p60 (TNFRSF1A; 191190) and p80 (TNFRSF1B) TNFA receptors self- assemble through a distinct functional domain in the TNFR extracellular domain, termed the pre- ligand assembly domain (PLAD), in the absence of ligand. Deletion of the PLAD results in monomeric presentation of p60 or p80. Flow cytometric analysis showed that efficient TNFA binding depends on receptor self- assembly. They also found that other members of the TNF receptor superfamily, including the extracellular domains of TRAIL (TNFRSF10A; 603611), CD40 (TNFRSF5; 109535), and FAS (TNFRSF6; 134637), all self- associate but do not interact with heterologous receptors. Using Jurkat T cells, which express TNFR1 but little TNFR2, and Jurkat cells stably transfected with TNFR2, Li et al. (2002) confirmed that TNF stimulation, or stimulation with a TNFR2, but not TNFR1, agonist, causes a loss of TRAF2 (OMIM Ref. No. 601895) in the

TNFR2- expressing cells, but not the parental cell line, through a ubiquitination- and proteasome- dependent process. Binding analysis indicated that TRAF2 interacts with CIAP1 (OMIM Ref. No. 601712) and CIAP2 (OMIM Ref. No. 601721), which possess E3 ubiquitin ligase (e.g. UBE3A, 601623) activity. Ubiquitination assays and SDS-PAGE analysis showed that in the presence of an E2- conjugating enzyme (e.g., UBCH7, 603721), CIAP1, but not CIAP2, induces TRAF2 ubiquitination outside of its RING domain. Both CIAPs bind but neither ubiquitinates TRAF1 (OMIM Ref. No. 601711). CIAP1 expression fails to protect TNFR2- expressing cells from TNF- induced apoptosis, whereas an E3- inactive CIAP1 mutant and wildtype CIAP2 do protect cells from TRAF2 downregulation and cause a delay in cell death. Li et al. (2002) concluded that TNFR2 stimulation causes the ubiquitination of TRAF2 by CIAP1, which can play a proapoptotic role in TNF signaling.

[12271] Animal model experiments lend further support to the function of TNFRSF1B. Bruce et al. (1996) used targeted gene disruption to generate mice lacking either the p55 (TNFR1) or the p75 (TNFR2) TNF receptor; mice lacking both p55 and p75 were generated from crosses of the singly deficient mice. The TNFR- deficient (TNFR- KO)

mice exhibited no overt phenotype under unchallenged conditions. Bruce et al. (1996) reported that damage to neurons caused by focal cerebral ischemia and epileptic seizures was exacerbated in the TNFR- KO mice, indicating that TNF serves a neuroprotective function. Their studies indicated that TNF protects neurons by stimulating antioxidative pathways. Injury- induced microglial activation was suppressed in TNFR- KO mice. They concluded that drugs which target TNF signaling pathways may prove beneficial in treating stroke or traumatic brain injury.

[12272] It is appreciated that the abovementioned animal model for TNFRSF1B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[12273] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12274] Chan, F. K.- M.; Chun, H. J.; Zheng, L.; Siegel, R. M.; Bui, K. L.; Lenardo, M. J. : A domain in TNF receptors that mediates ligand- independent receptor assembly and signaling. Science 288: 2351- 2354, 2000. ; and

[12275] Li, X.; Yang, Y.; Ashwell, J. D. : TNF- RII and c- IAP1 medi-

ate ubiquitination and degradation of TRAF2. Nature 416: 345- 349, 2002.

[12276] Further studies establishing the function and utilities of TNFRSF1B are found in John Hopkins OMIM database record ID 191191, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tumor necrosis factor (ligand) superfamily, member 10 (TNFSF10, Accession NM_003810.2) is another GAM72 target gene, herein designated TARGET GENE. TNFSF10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFSF10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNFSF10 BINDING SITE, designated SEQ ID:15311, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12277] Another function of GAM72 is therefore inhibition of Tumor necrosis factor (ligand) superfamily, member 10 (TNFSF10, Accession NM_003810.2), a gene which mediates cell death. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF10.

[12278] The function of TNFSF10 has been established by previous studies. Degli- Esposti et al. (1997) noted that TRAIL can induce apoptosis in a wide variety of transformed cell lines of diverse lineage, but does not appear to kill normal cells even though TRAIL mRNA is expressed at significant levels in most normal tissues. They suggested that the regulation of TRAIL function takes place at the level of receptor expression. The TRAIL receptors TRAILR1, also called DR4 (OMIM Ref. No. 603611), and TRAILR2, also called DR5 (OMIM Ref. No. 603612), are capable of mediating apoptosis. Two other receptors, TRAILR3 (OMIM Ref. No. 603613) and TRAILR4 (OMIM Ref. No. 603614), do not signal apoptosis and are potential decoy receptors for TRAIL. Cell death induced by TRAIL had been believed to occur exclusively in tumor cells, suggesting that this drug was safe to use as an antitumor therapy. Nitsch et al. (2000) reported that TRAIL induced apoptosis in the human brain, which argues against the use of TRAIL for therapy of human brain tumors. However, neuroinflammatory T cells that express TRAIL might induce apoptosis of brain tissue, indicating a potential target for treatment of multiple sclerosis.

[12279] Animal model experiments lend further support to the

function of TNFSF10. Cretney et al. (2002) generated healthy, fertile Trail- deficient mice by homologous recombination. Functional analysis confirmed the importance of Trail in mediating natural killer (NK) cytotoxicity to some tumor target cells. The authors found that Trail contributes to NK cell suppression of metastases to liver by a renal adenocarcinoma and to multiple tissues by breast carcinoma cells. Trail - /- mice were also more susceptible than wildtype mice to early onset of fibrosarcomas from lower doses of methylcholanthrene.

[12280] It is appreciated that the abovementioned animal model for TNFSF10 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[12281] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12283] Nitsch, R.; Bechmann, I.; Deisz, R. A.; Haas, D.; Lehmann,

T. N.; Wendling, U.; Zipp, F. : Human brain- cell death induced by tumour- necrosis- factor- related apoptosis-inducing ligand (TRA.

[12284] Further studies establishing the function and utilities of TNFSF10 are found in John Hopkins OMIM database record ID 603598, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tropomyosin 4 (TPM4, Accession NM_003290.1) is another GAM72 target gene, herein designated TARGET GENE. TPM4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TPM4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TPM4 BINDING SITE, designated SEQ ID:11140, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12285] Another function of GAM72 is therefore inhibition of Tropomyosin 4 (TPM4, Accession NM_003290.1), a gene which plays a central role, in association with the troponin complex, in the calcium dependent regulation of vertebrate striated muscle contraction. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with TPM4.

[12286] The function of TPM4 has been established by previous studies. Vertebrates have at least 4 different tropomyosin genes; in humans, they are named TPM1 (OMIM Ref. No. 191010), TPM2 (OMIM Ref. No. 190990), TPM3 (OMIM Ref. No. 191030), and TPM4. Both the muscle and nonmuscle isoforms of the tropomyosins are expressed through alternative splicing of each of the 4 genes. Laing et al. (1995) referred to unpublished observations indicating that the TPM4 gene maps to human chromosome 19. Wilton et al. (1996) developed sequence tagged sites (STS) for the TPM4 gene. One STS was used to amplify DNA from somatic cell hybrids to localize TPM4 to chromosome 19. The other, a product from a long- range PCR, was used directly as a probe to refine the localization of TPM4 to 19p13.1 by fluorescence in situ hybridization to metaphase chromosome spreads.

[12287]

[12288] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12289] Laing, N. G.; Wilton, S. D.; Akkari, P. A.; Dorosz, S.; Boundy, K.; Kneebone, C.; Blumbergs, P.; White, S.;

Watkins, H.; Love, D. R.; Haan, E. : A mutation in the alpha tropomyosin gene TPM3 associated with autosomal dominant nemaline myopathy. Nature Genet. 9: 75- 79, 1995. ; and

[12290] Wilton, S. D.; Lim, L.; Dorosz, S. D.; Gunn, H. C.; Eyre, H. J.; Callen, D. F.; Laing, N. G. : Assignment of the human alpha- tropomyosin gene TPM4 to band 19p13.1 by fluorescence in situ hy.

[12291] Further studies establishing the function and utilities of TPM4 are found in John Hopkins OMIM database record ID 600317, and in cited publications listed in Table 5, which are hereby incorporated by reference.Tripartite motif-containing 9 (TRIM9, Accession NM_015163.3) is another GAM72 target gene, herein designated TARGET GENE. TRIM9 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by TRIM9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:12950, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12292] Another function of GAM72 is therefore inhibition of Tri-

partite motif-containing 9 (TRIM9, Accession NM_015163.3), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n- linked. oligosaccharides. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9.

[12293] The function of TRIM9 has been established by previous studies. TRIM proteins are composed of 3 zinc- binding domains, a RING, a B- box type 1, and a B- box type 2, followed by a coiled- coil region. They are involved in development and cell growth. By EST database searching for B- box- containing proteins, Reymond et al. (2001) identified 37 TRIM members, including 3 isoforms of TRIM9. Northern blot analysis revealed high expression of a 4.4-kb TRIM9 transcript in brain. Fluorescence microscopy demonstrated expression of TRIM9 in cytoplasmic speckles. Interaction mating analysis indicated that TRIM9 can form a homodimer.

[12294]

[12295] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[12296] Li, Y.; Chin, L.- S.; Weigel, C.; Li, L. : Spring, a novel RING finger protein that regulates synaptic vesicle exocytosis. J. Biol. Chem. 276: 40824- 40833, 2001. ; and

[12297] Reymond, A.; Meroni, G.; Fantozzi, A.; Merla, G.; Cairo, S.; Luzi, L.; Riganelli, D.; Zanaria, E.; Messali, S.; Cainarca, S.; Guffanti, A.; Minucci, S.; Pelicci, P. G.; Ballabio, A. :.

[12298] Further studies establishing the function and utilities of TRIM9 are found in John Hopkins OMIM database record ID 606555, and in cited publications listed in Table 5, which are hereby incorporated by reference.Translin (TSN, Accession NM_004622.2) is another GAM72 target gene, herein designated TARGET GENE. TSN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TSN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TSN BINDING SITE, designated SEQ ID:11699, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12299] Another function of GAM72 is therefore inhibition of Translin (TSN, Accession NM_004622.2), a gene which is a

DNA binding protein and involved in DNA repair, replication, or recombination. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSN.

[12300] The function of TSN has been established by previous studies. Kasai et al. (1994) identified a protein they termed recombination hotspot- associated factor (RcHF1), which specifically binds to the signal- like sequences at the breakpoint junction of 8q24 and 1p32 in acute lymphoblastic leukemia (ALL) patients carrying t(8;14)(q24;q11) and t(1;14)(p32;q11) translocations involving the TCR delta- chain locus (TCRD; 186810). Aoki et al. (1994) showed that an analogous protein, which they designated BCLF1, specifically binds to a target sequence within the clustered breakpoint region of the BCL2 oncogene (OMIM Ref. No. 151430) in follicular lymphoma patients carrying t(14;18)(q32;q21) translocations. It was proposed that these binding activities at recombination hotspot regions may play a crucial role in chromosomal translocations in lymphoid neoplasms. Aoki et al. (1995) purified the BCLF1 protein to homogeneity and determined that it is identical to RcHF1. Molecular gene cloning experiments revealed that the purified protein, which they

named translin (TSN), is a previously undescribed DNA-binding protein with no significant similarity to known proteins. (The designation 'translin' came from selected letters in 'translocation.') In addition, Aoki et al. (1995) found that nuclear localization of translin was limited to lymphoid cell lines with rearranged Ig and processes such as DNA repair, replication, or recombination. In their native form, translin polypeptides form a multimeric structure that is responsible for its DNA binding activity. Aoki et al. (1997) found that the human and mouse translin genes have identical genomic structures consisting of 6 exons, 5 introns, and a GC- rich upstream region. By in situ hybridization and analysis of somatic cell hybrids, Aoki et al. (1997) mapped the human TSN gene to 2q21.1. Badge et al. (2000) studied a subtelomeric region at 16p13.3 that displays a 300- fold increase in crossovers compared to the genomic average rate. Segregation analysis of CEPH and other pedigrees yielded 6 paternal crossover breakpoints in the approximately 85- kb interval between the minisatellite loci D16S309 (MS205) and D16S83 (OMIM Ref. No. EKMDA2). Three crossovers were mapped to within the same small (less than 3 kb) interval, which did not colocalize with any tandem repeat array or

expressed sequence. Sequence analysis revealed the presence of recombination- associated motifs and binding sites for translin. The authors concluded that this locus represents an intense male- specific recombination hotspot. Hosaka et al. (2000) demonstrated that the presence of the translin binding motif may be one of the important determinants for the location of breakpoints in the TLS (OMIM Ref. No. 137070) and CHOP (OMIM Ref. No. 126337) genes which are fused by translocation t(12;16) in liposarcomas.

[12301]

[12302] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12303] Badge, R. M.; Yardley, J.; Jeffreys, A. J.; Armour, J. A. L. : Crossover breakpoint mapping identifies a subtelomeric hotspot for male meiotic recombination. Hum. Molec. Genet. 9: 1239- 1244, 2000. ; and

[12305] Further studies establishing the function and utilities of

TSN are found in John Hopkins OMIM database record ID 600575, and in cited publications listed in Table 5, which are hereby incorporated by reference.UBCE7IP5 (Accession NM_014948.1) is another GAM72 target gene, herein designated TARGET GENE. UBCE7IP5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UBCE7IP5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBCE7IP5 BINDING SITE, designated SEQ ID:504, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12306] Another function of GAM72 is therefore inhibition of UBCE7IP5 (Accession NM_014948.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBCE7IP5.

[12307] Ubiquitin-conjugating enzyme e2b (rad6 homolog) (UBE2B, Accession NM_003337.1) is another GAM72 target gene, herein designated TARGET GENE. UBE2B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UBE2B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE2B BINDING SITE, designated SEQ ID:19646, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12308] Another function of GAM72 is therefore inhibition of Ubiquitin-conjugating enzyme e2b (rad6 homolog) (UBE2B, Accession NM_003337.1), a gene which catalyzes the covalent attachment of ubiquitin to other proteins and is required for postreplication repair of uv- damaged dna. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2B.

[12309] The function of UBE2B has been established by previous studies. The RAD6 pathway is central to postreplicative DNA repair in eukaryotic cells. Two principal elements of this pathway are the ubiquitin- conjugating enzymes RAD6 and the MMS2 (OMIM Ref. No. 603001)- UBC13 (OMIM Ref. No. 603679) heterodimer, which are recruited to chromatin by the RING- finger proteins RAD18 (OMIM Ref. No. 605256) and RAD5 (OMIM Ref. No. 607266), respectively. Hoege et al. (2002) showed that UBC9 (OMIM Ref. No. 601661), a small ubiquitin- related modifier

(SUMO)- conjugating enzyme, is also affiliated with this pathway and that proliferating cell nuclear antigen (PCNA; 176740), a DNA polymerase sliding clamp involved in DNA synthesis and repair, is a substrate. PCNA is monoubiquitinated through RAD6 and RAD18, modified by lys63- linked multiubiquitination, which additionally requires MMS2, UBC13, and RAD5, and is conjugated to SUMO by UBC9. All 3 modifications affect the same lysine residue of PCNA, K164, suggesting that they label PCNA for alternative functions. Hoege et al. (2002) demonstrated that these modifications differentially affect resistance to DNA damage, and that damage- induced PCNA ubiquitination is elementary for DNA repair and occurs at the same conserved residue in yeast and humans.

[12310] Animal model experiments lend further support to the function of UBE2B. Roest et al. (1996) reported the phenotype of the first animal mutant in the ubiquitin pathway. Experimental inactivation of the RAD6B gene in mice caused male infertility. Derailment of spermatogenesis became overt during the postmeiotic condensation of chromatin in spermatids. In yeast the gene is not only implicated in postreplication repair and damage- induced mutagenesis but is also required for sporulation and may

modulate chromatin structure via histone ubiquitination. The authors stated that the findings in the 'knock- out' mice provided a parallel between yeast sporulation and mammalian spermatogenesis and strongly implicated RAD6- dependent ubiquitination in chromatin remodeling in the human. Since heterozygous male mice and even knockout female mice are completely normal and fertile and thus able to transmit the defect, similar RAD6B mutations may cause male infertility in man. The fact that the RAD6B mice are viable and phenotypically normal is presumably due to functional redundancy with RAD6A (OMIM Ref. No. 312180).

[12311] It is appreciated that the abovementioned animal model for UBE2B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[12312] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12313] Hoege, C.; Pfander, B.; Moldovan, G.- L.; Pyrowolakis, G.; Jentsch, S. : RAD6- dependent DNA repair is linked to modification of PCNA by ubiquitin and SUMO. Nature 419: 135- 141, 2002. ; and

[12314] Roest, H. P.; van Klaveren, J.; de Wit, J.; van Gurp, C. G.; Koken, M. H. M.; Vermey, M.; van Roijen, J. H.; Hooger-brugge, J. W.; Vreeburg, J. T. M.; Baarends, W. M.; Bootsma, D.; Grootego.

[12315] Further studies establishing the function and utilities of UBE2B are found in John Hopkins OMIM database record ID 179095, and in cited publications listed in Table 5, which are hereby incorporated by refer-ence.Ubiquitin-conjugating enzyme e2g 2 (ubc7 homolog, yeast) (UBE2G2, Accession NM_003343.2) is another GAM72 target gene, herein designated TARGET GENE. UBE2G2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UBE2G2, cor-responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-lustrates the complementarity of the nucleotide sequences of UBE2G2 BINDING SITE, designated SEQ ID:7019, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12316] Another function of GAM72 is therefore inhibition of Ubiquitin-conjugating enzyme e2g 2 (ubc7 homolog, yeast) (UBE2G2, Accession NM_003343.2), a gene which catalyzes the covalent attachment of ubiquitin to other

proteins. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2G2.

[12317] The function of UBE2G2 has been established by previous studies. In eukaryotes, conjugation of target proteins to ubiquitin is an essential step in the proteasome- dependent degradation process and is mediated by a family of ubiquitin- conjugating (UBC) enzymes. See 600012. Katsanis and Fisher (1998) stated that S. cerevisiae Ubc7 is an endoplasmic reticulum- bound molecule whose active site faces the cytosol. Ubc7 has been shown to confer resistance to cadmium and to participate in the degradation of specific yeast proteins. As part of an effort to generate a transcriptional map of human chromosome 21, Katsanis and Fisher (1998) identified UBE2G2 cDNAs. The predicted 165- amino acid protein shares 60% sequence identity with yeast Ubc7. The nucleotide sequence of UBE2G2 is 57% similar to that of UBE2G (OMIM Ref. No. 601569), another human Ubc7 homolog. Northern blot analysis revealed that UBE2G2 is expressed ubiquitously as 2.9- and 7- kb mRNAs. The highest level of expression was seen in skeletal muscle. By inclusion within mapped clones and by analysis of somatic cell hybrid panels, Katsanis and Fisher

(1998) mapped the UBE2G2 gene to 21q22.3. Rose et al. (1998) confirmed the localization to 21q22.3 by FISH.

[12318]

[12319] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12320] Katsanis, N.; Fisher, E. M. C. : Identification, expression, and chromosomal localization of ubiquitin conjugating enzyme 7 (UBE2G2), a human homologue of the Saccharomyces cerevisiae Ubc7 gene. Genomics 51: 128- 131, 1998. ; and

[12321] Rose, S. A.; Leek, J. P.; Moynihan, T. P.; Ardley, H. C.; Markham, A. F.; Robinson, P. A. : Assignment of the ubiquitin conjugating enzyme gene, UBE2G2, to human chromosome band 21q22.3.

[12322] Further studies establishing the function and utilities of UBE2G2 are found in John Hopkins OMIM database record ID 603124, and in cited publications listed in Table 5, which are hereby incorporated by reference.Vitamin d (1,25- dihydroxyvitamin d3) receptor (VDR, Accession NM_000376.1) is another GAM72 target gene, herein designated TARGET GENE. VDR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA en-

coded by VDR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VDR BINDING SITE, designated SEQ ID:16133, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12323] Another function of GAM72 is therefore inhibition of Vitamin d (1,25- dihydroxyvitamin d3) receptor (VDR, Accession NM_000376.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDR.

[12324] Von hippel-lindau syndrome (VHL, Accession NM_000551.1) is another GAM72 target gene, herein designated TARGET GENE. VHL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VHL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VHL BINDING SITE, designated SEQ ID:11294, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12325] Another function of GAM72 is therefore inhibition of Von hippel-lindau syndrome (VHL, Accession NM_000551.1), a

gene which may control rna stability through the selective degradation of rna- bound proteins. and therefore is associated with Von hippel- lindau disease. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of Von hippel- lindau disease, and of other diseases and clinical conditions associated with VHL.

[12326] The function of VHL has been established by previous studies. Interfamilial differences in predisposition to pheochromocytoma in VHL reflect allelic heterogeneity such that there is a strong association between missense mutations and risk of pheochromocytoma. Prowse et al. (1997) investigated the mechanism of tumorigenesis in VHL tumors to determine whether there were differences between tumor types or classes of germline mutations. They studied 53 tumors (30 renal cell carcinomas, 15 hemangioblastomas, 5 pheochromocytomas, and 3 pancreatic tumors) from 33 patients (27 kindreds) with VHL. Overall, 51% of 45 informative tumors showed LOH at the VHL locus. In 11 cases, it was possible to distinguish between loss of the wildtype and mutant alleles, and in each case the wildtype allele was lost. LOH was detected in all tumor types and occurred in the presence of both germline missense mutations and other types of germline

mutation associated with a low risk of pheochromocytoma. Intragenic somatic mutations were detected in 3 tumors (all hemangioblastomas) and in 2 of these could be shown to occur in the wildtype allele. Their study provided the first example of homozygous inactivation of the VHL gene by small intragenic mutations in this type of tumor. Hypermethylation of the VHL gene was detected in 33% (6 of 18) of tumors without LOH, including 2 renal cell carcinomas and 4 hemangioblastomas. Prowse et al. (1997) stated that, although hypermethylation of the VHL gene had been reported previously in nonfamilial RCC and although methylation of tumor- suppressor genes had been implicated in the pathogenesis of other sporadic cancers, this was the first report of somatic methylation in a familial cancer syndrome. Herman et al. (1994) observed hypermethylation of the VHL gene in 19% of sporadic RCCs. Versteeg (1997) provided a general discussion of aberrant methylation in cancer.

[12327] Animal model experiments lend further support to the function of VHL. Gemmill et al. (2002) isolated the Drosophila homolog of TRC8 (OMIM Ref. No. 603046) and studied its function by genetic manipulations and a yeast 2- hybrid screen. Human and Drosophila TRC8 proteins

localize to the endoplasmic reticulum. Loss of either Drosophila Trc8 or Vhl resulted in an identical ventral midline defect. Direct interaction between Trc8 and Vhl in drosophila was confirmed by GST- pulldown and coimmunoprecipitation experiments. Gemmill et al. (2002) found that in Drosophila, overexpression of Trc8 inhibited growth consistent with its presumed role as a tumor suppressor gene. Human JAB1 (OMIM Ref. No. 604850) localization was dependent on VHL mutant status. Thus, the VHL, TRC8, and JAB1 proteins appear to be linked both physically and functionally, and all 3 may participate in the development of kidney cancer.

[12328] It is appreciated that the abovementioned animal model for VHL is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[12329] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12330] Herman, J. G.; Latif, F.; Weng, Y.; Lerman, M. I.; Zbar, B.; Liu, S.; Samid, D.; Duan, D.- S. R.; Guarra, J. R.; Linehan, W. M.; Baylin, S. B. : Silencing of the VHL tumor- suppressor gene by DNA methylation in renal carcinomas. Proc.

Nat. Acad. Sci. 91: 9700- 9704, 1994. ; and

[12332] Further studies establishing the function and utilities of VHL are found in John Hopkins OMIM database record ID 193300, and in cited publications listed in Table 5, which are hereby incorporated by reference.Vacuolar protein sorting 41 (yeast) (VPS41, Accession NM_014396.2) is another GAM72 target gene, herein designated TARGET GENE. VPS41 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by VPS41, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of VPS41 BINDING SITE, designated SEQ ID:16653, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12333] Another function of GAM72 is therefore inhibition of Vacuolar protein sorting 41 (yeast) (VPS41, Accession NM_014396.2) . Accordingly, utilities of GAM72 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS41.

[12334] WW45 (Accession) is another GAM72 target gene, herein designated TARGET GENE. WW45 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WW45, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WW45 BINDING SITE, designated SEQ ID:16137, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12335] Another function of GAM72 is therefore inhibition of WW45 (Accession), a gene which is required for ubiquitination and therefore degradation of several cell surface proteins like gap1, fur4, mal61 and ste2. also acts on rbp1. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WW45.

[12336] The function of WW45 has been established by previous studies. By searching an EST database using C. elegans and Drosophila WW domain- containing protein sequences as bait, followed by 5- prime and 3- prime RACE using a human heart cDNA library, Valverde (2000) ob-

tained a full- length cDNA encoding WW45. The deduced 383- amino acid protein has a predicted molecular mass of approximately 45 kD. It contains 2 WW domains, a region rich in prolines and glutamines, and a coiled- coil region, as well as a nuclear localization signal and 2 endoplasmic reticulum retention signals. The mouse Ww45 cDNA has a different 3- prime untranslated region and encodes a protein that shares 93% identity with human WW45. Northern blot and RT- PCR analyses demonstrated that both human and mouse WW45 transcripts (1.2 and 2.7 kb, respectively) are ubiquitously expressed in adult tissues. In human, highest expression was in pancreas, while in mouse, highest expression was in testis. Northern blot analysis of whole mouse embryos showed that embryonic expression of Ww45 first occurred at 7 days postcoitum. Expression levels markedly decreased at day 11 and remained low at days 15 and 17, suggesting that WW45 expression is developmentally regulated. Accordingly, expression of human WW45 was found to be higher in fetal heart than in adult heart. By radiation hybrid analysis, Valverde (2000) mapped the WW45 gene to chromosome 14q13- q23. In a screen for Drosophila mutations that result in tissue overgrowth, Tapon et al. (2002) iden-

tified salvador (sav), a gene that promotes both cell cycle exit and cell death. Elevated cyclin E (OMIM Ref. No. 123837) and inhibitor of apoptosis- 1 (Diap1) levels were found in mutant cells, resulting in delayed cell cycle exit and impaired apoptosis. Salvador contains 2 WW domains and binds to the Warts (or OMIM Ref. No. 603473) protein kinase. Because WW45 is the human ortholog of salvador, Tapon et al. (2002) sequenced the entire WW45 coding region in a panel of 52 tumor- derived cell lines, representing a broad range of tissue types. One colon cancer cell line, HCT15, had a heterozygous C- to- A mutation at nucleotide 554, resulting in an asp185- to- ala substitution. This mutation was not present in 185 population- based controls (370 chromosomes), indicating that it is not a common polymorphism. The authors noted that HCT15 carries a mutation in the mismatch repair gene MSH6 (OMIM Ref. No. 600678), which appears to enhance the frequency of point mutations in other genes. Two renal cancer cell lines, ACHN and 786- O, had deletions involving WW45. The normal allele was not present in either cell line, indicating that these cell lines were either homozygous or hemizygous for the deletion. The WW45 transcript was undetectable by RT- PCR in both cell lines, and a

Southern blot using a probe derived from the 3- prime portion of the gene demonstrated that this part of the gene was absent in both cell lines. In cell line 786- O, PCR analysis of genomic DNA indicated that there was a deletion of approximately 157 kb, with the 5- prime breakpoint between exons 2 and 3 of WW45. The deletion in ACHN of approximately 138 kb encompassed the entire gene. The common region of overlap between these 2 deletions was only 21 kb, containing exons 3 to 5 of WW45. No other transcription units were identified within this 21 kb interval.

[12337]

[12338] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12339] Tapon, N.; Harvey, K. F.; Bell, D. W.; Wahrer, D. C. R.; Schiripo, T. A.; Haber, D. A.; Hariharan, I. K. : salvador promotes both cell cycle exit and apoptosis in Drosophila and is mutated in human cancer cell lines. Cell 110: 467-478, 2002. ; and

[12340] Valverde, P. : Cloning, expression, and mapping of hWW45, a novel human WW domain- containing gene. Biochem. Biophys. Res. Commun. 276: 990- 998, 2000.

[12341] Further studies establishing the function and utilities of WW45 are found in John Hopkins OMIM database record ID 607203, and in cited publications listed in Table 5, which are hereby incorporated by reference.X-ray repair complementing defective repair in chinese hamster cells 2 (XRCC2, Accession NM_005431.1) is another GAM72 target gene, herein designated TARGET GENE. XRCC2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by XRCC2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of XRCC2 BINDING SITE, designated SEQ ID:12295, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12342] Another function of GAM72 is therefore inhibition of X-ray repair complementing defective repair in chinese hamster cells 2 (XRCC2, Accession NM_005431.1), a gene which involves in the homologous recombination repair (hrr) pathway of double- stranded dna. Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XRCC2.

[12343] The function of XRCC2 has been established by previous

studies. Johnson et al. (1999) demonstrated that XRCC2 is essential for the efficient repair of DNA double- strand breaks by homologous recombination between sister chromatids. Hamster cells deficient in XRCC2 showed a more than 100- fold decrease in homologous recombination induced by double- strand breaks compared with the parental cell line. This defect was corrected to almost wildtype levels by transient transfection with a plasmid expressing XRCC2. The repair defect in XRCC2 mutant cells appeared to be restricted to recombinational repair because nonhomologous end joining was normal. Johnson et al. (1999) concluded that XRCC2 is involved in the repair of DNA double- strand breaks by homologous recombination. Using a yeast 2- hybrid assay, Braybrooke et al. (2000) identified a direct interaction between XRCC2 and RAD51L3 (OMIM Ref. No. 602954), and they confirmed the interaction by pull- down assays between recombinant XRCC2 and endogenous RAD51L3 in HeLa cell extracts. Size- exclusion chromatography followed by Western blot analysis suggested that the 2 proteins exist as a heterodimer of about 70 kD.

[12344]

[12345] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[12346] Johnson, R. D.; Liu, N.; Jasin, M. : Mammalian XRCC2 promotes the repair of DNA double- strand breaks by homologous recombination. Nature 401: 397- 399, 1999. ; and

[12347] Braybrooke, J. P.; Spink, K. G.; Thacker, J.; Hickson, I. D. : The RAD51 family member, RAD51L3, is a DNA- stimulated ATPase that forms a complex with XRCC2. J. Biol. Chem. 275: 29100- 29.

[12348] Further studies establishing the function and utilities of XRCC2 are found in John Hopkins OMIM database record ID 600375, and in cited publications listed in Table 5, which are hereby incorporated by reference.ZFD25 (Accession NM_016220.1) is another GAM72 target gene, herein designated TARGET GENE. ZFD25 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZFD25, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZFD25 BINDING SITE, designated SEQ ID:2054, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12349] Another function of GAM72 is therefore inhibition of ZFD25 (Accession NM_016220.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFD25.

[12350] Zinc finger, imprinted 3 (ZIM3, Accession NM_052882.1) is another GAM72 target gene, herein designated TARGET GENE. ZIM3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZIM3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZIM3 BINDING SITE, designated SEQ ID:14398, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12351] Another function of GAM72 is therefore inhibition of Zinc finger, imprinted 3 (ZIM3, Accession NM_052882.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZIM3.

[12352] Zinc finger protein 14 (kox 6) (ZNF14, Accession NM_021030.1) is another GAM72 target gene, herein designated TARGET GENE. ZNF14 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by ZNF14, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ZNF14 BINDING SITE, designated SEQ ID:14474, to the nucleotide sequence of GAM72 RNA, herein designated GAM RNA, also designated SEQ ID:342.

[12353] Another function of GAM72 is therefore inhibition of Zinc finger protein 14 (kox 6) (ZNF14, Accession NM_021030.1) . Accordingly, utilities of GAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF14.

[12354]

[12355] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 73 (GAM73), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12356] GAM73 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM73 was detected is described hereinabove with reference to Figs. 8-15.

[12357] GAM73 gene, herein designated GAM GENE, and GAM73

target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[12358] GAM73 gene encodes a GAM73 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM73 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM73 precursor RNA is designated SEQ ID:18, and is provided hereinbelow with reference to the sequence listing part.

[12359] GAM73 precursor RNA folds onto itself, forming GAM73 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12360] GAM73 precursor RNA folds onto itself, forming GAM73 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[12361] Nucleotide sequence of GAM73 precursor RNA, designated SEQ-ID: 18, and a schematic representation of a predicted secondary folding of GAM73 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[12362] An enzyme complex designated DICER COMPLEX, `dices` the GAM73 folded precursor RNA into GAM73 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM73 RNA is designated SEQ ID:264, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[12363] GAM73 target gene, herein designated TARGET GENE, en-

codes a corresponding messenger RNA, GAM73 target RNA, herein designated GAM TARGET RNA. GAM73 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12364] GAM73 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM73 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM73 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM73 RNA may have a different number of target binding sites in untranslated regions of a GAM73 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12365] The complementary binding of GAM73 RNA, herein designated GAM RNA, to target binding sites on GAM73 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM73 target RNA into GAM73 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12366] It is appreciated that GAM73 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM73 target genes. The mRNA of each one of this plurality of GAM73 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM73 RNA, herein designated GAM RNA, and which when bound by GAM73 RNA causes inhibition of translation of respective one or more GAM73 target proteins.

[12367] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM73 gene, herein designated GAM GENE, on one or more GAM73 target genes, herein collectively designated

TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12368] It is appreciated that specific functions and accordingly utilities of GAM73 correlate with, and may be deduced from, the identity of the target genes which GAM73 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12369]

[12370]

[12371] Chromosome 17 open reading frame 26 (C17orf26, Accession NM_139177.1) is a GAM73 target gene, herein designated TARGET GENE. C17orf26 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by C17orf26, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C17orf26 BINDING SITE, designated SEQ ID:3694, to the nucleotide sequence of GAM73 RNA, herein designated GAM RNA, also designated SEQ ID:264.

[12372] A function of GAM73 is therefore inhibition of Chromosome 17 open reading frame 26 (C17orf26, Accession NM_139177.1) . Accordingly, utilities of GAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf26.

[12373] Grb2-associated binding protein 2 (GAB2, Accession NM_080491.1) is another GAM73 target gene, herein designated TARGET GENE. GAB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GAB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE, designated SEQ ID:18529, to the nucleotide sequence of GAM73 RNA, herein designated GAM RNA, also designated SEQ ID:264.

[12374] Another function of GAM73 is therefore inhibition of Grb2-associated binding protein 2 (GAB2, Accession NM_080491.1), a gene which act as adapters for transmitting various signals. Accordingly, utilities of GAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2.

[12375] The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM63.1.LOC144248 (Accession XM_084786.1) is another GAM73 target gene, herein designated TARGET GENE. LOC144248 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC144248, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144248 BINDING SITE, designated SEQ ID:10663, to the nucleotide sequence of GAM73 RNA, herein designated GAM RNA, also designated SEQ ID:264.

[12376] Another function of GAM73 is therefore inhibition of LOC144248 (Accession XM_084786.1) . Accordingly, utilities of GAM73 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC144248.

[12377] LOC197003 (Accession) is another GAM73 target gene, herein designated TARGET GENE. LOC197003 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC197003, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC197003 BINDING SITE, designated SEQ ID:7418, to the nucleotide sequence of GAM73 RNA, herein designated GAM RNA, also designated SEQ ID:264.

[12378] Another function of GAM73 is therefore inhibition of LOC197003 (Accession) . Accordingly, utilities of GAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197003.

[12379] Moesin (MSN, Accession NM_002444.1) is another GAM73 target gene, herein designated TARGET GENE. MSN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MSN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MSN BINDING

SITE, designated SEQ ID:8419, to the nucleotide sequence of GAM73 RNA, herein designated GAM RNA, also designated SEQ ID:264.

[12380] Another function of GAM73 is therefore inhibition of Moesin (MSN, Accession NM_002444.1), a gene which may have a role linking the cytoskeleton to the plasma membrane and therefore may be associated with Wiskott-aldrich syndrome. Accordingly, utilities of GAM73 include diagnosis, prevention and treatment of Wiskott- aldrich syndrome., and of other diseases and clinical conditions associated with MSN.

[12381] The function of MSN has been established by previous studies. Shcherbina et al. (1999) demonstrated a decrease in platelet moesin in patients with Wiskott- Aldrich syndrome (OMIM Ref. No. 301000). This appeared to be a secondary defect to the primary defect in the WASP gene. The WASP and MSN genes are both located on the X chromosome, on the short and the long arm, respectively. Using mouse helper T cell lines and confocal microscopy, Allenspach et al. (2001) determined that the cytoplasmic tail of CD43 is necessary and sufficient for CD43 removal from the immunologic synapse. In at least some cells, CD43 is located at the distal pole of the T cell together

with ezrin and moesin. No differences in the behavior of ezrin and moesin were noted throughout the study. Using cells from Cd43 - /- mice, Allenspach et al. (2001) observed that ezrin- radixin- moesin (ERM) family proteins move independently of the large CD43 mucin. Overexpression of a dominant- negative ERM mutant containing the N- terminal 320 amino acids of ezrin inhibited the activation- induced movement of CD43 without affecting conjugate formation. The dominant- negative mutant reduced cytokine production but not the expression of T-cell activation markers.

[12382]

[12383] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12384] Lankes, W.; Griesmacher, A.; Grunwald, J.; Schwartz- Albiez, R.; Keller, R. : A heparin- binding protein involved in inhibition of smooth- muscle cell proliferation. Biochem. J. 251: 831- 842, 1988. ; and

[12385] Lankes, W. T.; Furthmayr, H. : Moesin: a member of the protein 4.1- talin- ezrin family of proteins. Proc. Nat. Acad. Sci. 88: 8297- 8301, 1991.

[12386] Further studies establishing the function and utilities of

MSN are found in John Hopkins OMIM database record ID 309845, and in cited publications listed in Table 5, which are hereby incorporated by reference.RPH3A (Accession NM_014954.1) is another GAM73 target gene, herein designated TARGET GENE. RPH3A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RPH3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPH3A BINDING SITE, designated SEQ ID:13411, to the nucleotide sequence of GAM73 RNA, herein designated GAM RNA, also designated SEQ ID:264.

[12387] Another function of GAM73 is therefore inhibition of RPH3A (Accession NM_014954.1) . Accordingly, utilities of GAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPH3A.

[12388] Serine/threonine kinase 29 (STK29, Accession NM_003957.1) is another GAM73 target gene, herein designated TARGET GENE. STK29 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STK29, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of STK29 BINDING SITE, designated SEQ ID:15075, to the nucleotide sequence of GAM73 RNA, herein designated GAM RNA, also designated SEQ ID:264.

[12389] Another function of GAM73 is therefore inhibition of Serine/threonine kinase 29 (STK29, Accession NM_003957.1) . Accordingly, utilities of GAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK29.

[12390] Transient receptor potential cation channel, subfamily c, member 5 (TRPC5, Accession NM_012471.1) is another GAM73 target gene, herein designated TARGET GENE. TRPC5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRPC5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRPC5 BINDING SITE, designated SEQ ID:6129, to the nucleotide sequence of GAM73 RNA, herein designated GAM RNA, also designated SEQ ID:264.

[12391] Another function of GAM73 is therefore inhibition of Transient receptor potential cation channel, subfamily c, member 5 (TRPC5, Accession NM_012471.1) . Accordingly, utilities of GAM73 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with TRPC5.

[12392]

[12393] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 74 (GAM74), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12394] GAM74 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM74 was detected is described hereinabove with reference to Figs. 8-15.

[12395] GAM74 gene, herein designated GAM GENE, and GAM74 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[12396] GAM74 gene encodes a GAM74 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM74 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM74 precursor RNA is designated SEQ ID:87, and is provided hereinbelow with reference to the sequence list-

ing part. Nucleotide sequence SEQ ID:87 is located at position 60841960 relative to chromosome 18.

[12397] GAM74 precursor RNA folds onto itself, forming GAM74 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12398] GAM74 precursor RNA folds onto itself, forming GAM74 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[12399] Nucleotide sequence of GAM74 precursor RNA, designated SEQ-ID: 87, and a schematic representation of a predicted secondary folding of GAM74 folded precursor

RNA are further described with reference to Table 2, hereby incorporated by reference.

[12400] An enzyme complex designated DICER COMPLEX, `dices` the GAM74 folded precursor RNA into GAM74 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM74 RNA is designated SEQ ID:254, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[12401] GAM74 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM74 target RNA, herein designated GAM TARGET RNA. GAM74 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12402] GAM74 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in

untranslated regions of GAM74 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM74 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM74 RNA may have a different number of target binding sites in untranslated regions of a GAM74 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12403] The complementary binding of GAM74 RNA, herein designated GAM RNA, to target binding sites on GAM74 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM74 target RNA into GAM74 target protein, herein designated GAM TARGET PROTEIN. GAM target

protein is therefore outlined by a broken line.

[12404] It is appreciated that GAM74 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM74 target genes. The mRNA of each one of this plurality of GAM74 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM74 RNA, herein designated GAM RNA, and which when bound by GAM74 RNA causes inhibition of translation of respective one or more GAM74 target proteins.

[12405] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM74 gene, herein designated GAM GENE, on one or more GAM74 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific com-

plementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12406] It is appreciated that specific functions and accordingly utilities of GAM74 correlate with, and may be deduced from, the identity of the target genes which GAM74 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12407]

[12408]

[12409] DKFZp434G171 (Accession) is a GAM74 target gene, herein designated TARGET GENE. DKFZp434G171 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZp434G171, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp434G171 BINDING SITE, designated SEQ ID:3282, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12410] A function of GAM74 is therefore inhibition of DKFZp434G171 (Accession) . Accordingly, utilities of GAM74

include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434G171.

[12411] F-box only protein 9 (FBXO9, Accession NM_033481.1) is another GAM74 target gene, herein designated TARGET GENE. FBXO9 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FBXO9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FBXO9 BINDING SITE, designated SEQ ID:12849, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12412] Another function of GAM74 is therefore inhibition of F-box only protein 9 (FBXO9, Accession NM_033481.1) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO9.

[12413] Fibroblast growth factor receptor-like 1 (FGFRL1, Accession NM_021923.2) is another GAM74 target gene, herein designated TARGET GENE. FGFRL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FGFRL1, corresponding to a target binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FGFRL1 BINDING SITE, designated SEQ ID:2185, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12414] Another function of GAM74 is therefore inhibition of Fibroblast growth factor receptor-like 1 (FGFRL1, Accession NM_021923.2) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFRL1.

[12415] FLJ00024 (Accession XM_033361.2) is another GAM74 target gene, herein designated TARGET GENE. FLJ00024 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ00024, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:16152, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12416] Another function of GAM74 is therefore inhibition of FLJ00024 (Accession XM_033361.2) . Accordingly, utilities

of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024.

[12417] FLJ11136 (Accession) is another GAM74 target gene, herein designated TARGET GENE. FLJ11136 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11136, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11136 BINDING SITE, designated SEQ ID:3962, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12418] Another function of GAM74 is therefore inhibition of FLJ11136 (Accession) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11136.

[12419] FLJ12891 (Accession NM_024950.1) is another GAM74 target gene, herein designated TARGET GENE. FLJ12891 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ12891, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ12891 BINDING SITE, designated SEQ ID:1091, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12420] Another function of GAM74 is therefore inhibition of FLJ12891 (Accession NM_024950.1) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12891.

[12421] FLJ13195 (Accession NM_022906.1) is another GAM74 target gene, herein designated TARGET GENE. FLJ13195 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13195, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13195 BINDING SITE, designated SEQ ID:12499, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12422] Another function of GAM74 is therefore inhibition of FLJ13195 (Accession NM_022906.1) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13195.

[12423] FLJ14146 (Accession NM_024709.1) is another GAM74 target gene, herein designated TARGET GENE. FLJ14146

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14146, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14146 BINDING SITE, designated SEQ ID:11084, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12424] Another function of GAM74 is therefore inhibition of FLJ14146 (Accession NM_024709.1) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14146.

[12425] FLJ20211 (Accession NM_017713.1) is another GAM74 target gene, herein designated TARGET GENE. FLJ20211 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20211, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20211 BINDING SITE, designated SEQ ID:2327, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12426] Another function of GAM74 is therefore inhibition of

FLJ20211 (Accession NM_017713.1) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20211.

[12427] Holocarboxylase synthetase (biotin-[proprionyl-coenzyme a-carboxylase (atp-hydrolysing)] ligase) (HLCS, Accession NM_000411.3) is another GAM74 target gene, herein designated TARGET GENE. HLCS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HLCS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HLCS BINDING SITE, designated SEQ ID:10828, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12428] Another function of GAM74 is therefore inhibition of Holocarboxylase synthetase (biotin-[proprionyl-coenzyme a-carboxylase (atp-hydrolysing)] ligase) (HLCS, Accession NM_000411.3) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLCS.

[12429] KIAA0971 (Accession NM_014929.1) is another GAM74 target gene, herein designated TARGET GENE. KIAA0971 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA0971, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0971 BINDING SITE, designated SEQ ID:1934, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12430] Another function of GAM74 is therefore inhibition of KIAA0971 (Accession NM_014929.1) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0971.

[12431] LOC147920 (Accession XM_085932.5) is another GAM74 target gene, herein designated TARGET GENE. LOC147920 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC147920, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147920 BINDING SITE, designated SEQ ID:11680, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12432] Another function of GAM74 is therefore inhibition of

LOC147920 (Accession XM_085932.5) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147920.

[12433] LOC158230 (Accession XM_088517.1) is another GAM74 target gene, herein designated TARGET GENE. LOC158230 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158230, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158230 BINDING SITE, designated SEQ ID:7124, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12434] Another function of GAM74 is therefore inhibition of LOC158230 (Accession XM_088517.1) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158230.

[12435] LOC164955 (Accession XM_092265.4) is another GAM74 target gene, herein designated TARGET GENE. LOC164955 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC164955, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC164955 BINDING SITE, designated SEQ ID:7799, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12436] Another function of GAM74 is therefore inhibition of LOC164955 (Accession XM_092265.4) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164955.

[12437] LOC195977 (Accession XM_113625.3) is another GAM74 target gene, herein designated TARGET GENE. LOC195977 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC195977, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC195977 BINDING SITE, designated SEQ ID:12998, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12438] Another function of GAM74 is therefore inhibition of LOC195977 (Accession XM_113625.3) . Accordingly, utili-

ties of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC195977.

[12439] LOC220776 (Accession) is another GAM74 target gene, herein designated TARGET GENE. LOC220776 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC220776, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:1233, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12440] Another function of GAM74 is therefore inhibition of LOC220776 (Accession) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220776.

[12441] LOC257576 (Accession) is another GAM74 target gene, herein designated TARGET GENE. LOC257576 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC257576, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the

complementarity of the nucleotide sequences of LOC257576 BINDING SITE, designated SEQ ID:18100, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12442] Another function of GAM74 is therefore inhibition of LOC257576 (Accession) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257576.

[12443] LOC92840 (Accession NM_138393.1) is another GAM74 target gene, herein designated TARGET GENE. LOC92840 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC92840, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92840 BINDING SITE, designated SEQ ID:13076, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12444] Another function of GAM74 is therefore inhibition of LOC92840 (Accession NM_138393.1) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92840.

[12445] Lymphotoxin beta receptor (tnfr superfamily, member 3) (LTBR, Accession NM_002342.1) is another GAM74 target gene, herein designated TARGET GENE. LTBR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LTBR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LTBR BINDING SITE, designated SEQ ID:2499, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12446] Another function of GAM74 is therefore inhibition of Lymphotoxin beta receptor (tnfr superfamily, member 3) (LTBR, Accession NM_002342.1), a gene which is a receptor for the heterotrimeric lymphotoxin containing lta and ltb, and for tnfs14/light. promotes apoptosis via traf3 and traf5. may play a role in the development of lymphoid organs. Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTBR.

[12447] The function of LTBR has been established by previous studies. Crowe et al. (1994) demonstrated that the tumor necrosis factor receptor related protein is the human re-

ceptor for the heterotrimer of lymphotoxin- alpha (OMIM Ref. No. 153440) and lymphotoxin- beta (OMIM Ref. No. 600978). This LT- alpha/LT- beta heterotrimer is assumed to take part in immunologic reactions by cell- cell contact, but does not bind to either TNFR1 (OMIM Ref. No. 191190) or TNFR2 (OMIM Ref. No. 191191). Nakamura et al. (1995) isolated the LT- beta receptor cDNA from a cDNA library of murine embryonic heart mRNA, using the signal sequence trap (SST) method, a newly developed strategy for cloning secreted proteins and type I membrane proteins (Tashiro et al., 1993). This method, which does not require specific functional assays, takes advantage of the fact that their precursors carry amino- terminal signal sequences. The deduced amino acid sequence of the mouse LT- beta receptor is 66% identical to that of the human protein. Northern analysis of various organs in adult mice have showed that expression levels of LTBR mRNA were strong in lung, liver, and kidney, moderate in heart and testes, but weak in brain, thymus, spleen, and lymph nodes. Nakamura et al. (1995) speculated that, since the mouse receptor was already expressed in 7 day- postcoitus embryos, the LT- alpha/LT- beta receptor system may have some function in early embryogenesis. By

linkage analysis with recombinant inbred mouse strains, Nakamura et al. (1995) demonstrated that the locus, designated Tnfcr, is very close to the Tnfr1 gene on mouse chromosome 6. Presumably, the human homolog is located on 12p13

[12448]

[12451] Nakamura, T.; Tashiro, K.; Nazarea, M.; Nakano, T.; Sasayama, S.; Honjo, T. : The murine lymphotoxin- beta receptor cDNA: isolation by the signal sequence trap and chromosomal mapping. Gen.

[12452] Further studies establishing the function and utilities of LTBR are found in John Hopkins OMIM database record ID 600979, and in cited publications listed in Table 5, which are hereby incorporated by reference.MGC14425 (Accession NM_032903.1) is another GAM74 target gene, herein designated TARGET GENE. MGC14425 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC14425, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC14425 BINDING SITE, designated SEQ ID:9928, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12453] Another function of GAM74 is therefore inhibition of MGC14425 (Accession NM_032903.1) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14425.

[12454] MGC16037 (Accession NM_032887.1) is another GAM74 target gene, herein designated TARGET GENE. MGC16037 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC16037, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC16037 BINDING SITE, designated SEQ ID:6563, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12455] Another function of GAM74 is therefore inhibition of MGC16037 (Accession NM_032887.1) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16037.

[12456] P53AIP1 (Accession NM_022112.1) is another GAM74 target gene, herein designated TARGET GENE. P53AIP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by P53AIP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P53AIP1 BINDING SITE, designated SEQ ID:13522, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12457] Another function of GAM74 is therefore inhibition of P53AIP1 (Accession NM_022112.1) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P53AIP1.

[12458] Protein regulator of cytokinesis 1 (PRC1, Accession NM_003981.1) is another GAM74 target gene, herein designated TARGET GENE. PRC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by PRC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRC1 BINDING SITE, designated SEQ ID:14663, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12459] Another function of GAM74 is therefore inhibition of Protein regulator of cytokinesis 1 (PRC1, Accession NM_003981.1) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRC1.

[12460] Ring1 and yy1 binding protein (RYBP, Accession NM_012234.3) is another GAM74 target gene, herein designated TARGET GENE. RYBP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RYBP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RYBP BINDING SITE, designated SEQ ID:15729, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12461] Another function of GAM74 is therefore inhibition of Ring1 and yy1 binding protein (RYBP, Accession

NM_012234.3) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RYBP.

[12462] Solute carrier family 37 (glycerol-3-phosphate transporter), member 1 (SLC37A1, Accession NM_018964.2) is another GAM74 target gene, herein designated TARGET GENE. SLC37A1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC37A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC37A1 BINDING SITE, designated SEQ ID:6854, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12463] Another function of GAM74 is therefore inhibition of Solute carrier family 37 (glycerol-3-phosphate transporter), member 1 (SLC37A1, Accession NM_018964.2) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC37A1.

[12464] Solute carrier family 38, member 5 (SLC38A5, Accession NM_033518.1) is another GAM74 target gene, herein designated TARGET GENE. SLC38A5 BINDING SITE is a target

binding site found in the 5` untranslated region of mRNA encoded by SLC38A5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC38A5 BINDING SITE, designated SEQ ID:1536, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12465] Another function of GAM74 is therefore inhibition of Solute carrier family 38, member 5 (SLC38A5, Accession NM_033518.1) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC38A5.

[12466] Solute carrier family 7 (cationic amino acid transporter, y+ system), member 6 (SLC7A6, Accession NM_003983.1) is another GAM74 target gene, herein designated TARGET GENE. SLC7A6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC7A6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC7A6 BINDING SITE, designated SEQ ID:11061, to the nucleotide sequence of GAM74 RNA,

herein designated GAM RNA, also designated SEQ ID:254.

[12467] Another function of GAM74 is therefore inhibition of Solute carrier family 7 (cationic amino acid transporter, y+ system), member 6 (SLC7A6, Accession NM_003983.1), a gene which is involved in mediating amino acid transport. Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A6.

[12468] The function of SLC7A6 has been established by previous studies. Using RT- PCR with degenerate primers to screen for amino acid transporters in opossum kidney, followed by searching EST databases, Torrents et al. (1998) obtained a cDNA encoding SLC7A6, which they called y(+)LAT2. SLC7A6 is identical to the KIAA0245 gene reported by Nagase et al. (1996). Sequence analysis predicted that SLC7A6 is a 515- amino acid, typical organic solute transporter protein with 12 transmembrane domains, 3 potential phosphorylation sites, and N- and C-terminal cytoplasmic segments. SLC7A6 shares 75% amino acid identity with the opossum sequence and y(+)LAT1 (SLC7A7; 603593). By RT- PCR analysis, Nagase et al. (1996) detected SLC7A6 expression in all tissues tested except liver; expression was weak in pancreas and highest

in thymus.

[12469]

[12470] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12471] Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kawarabayasi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. VI. The coding sequences of 80 new genes (KIAA0201- KIAA0280) deduced by analysis of cDNA clones from cell line KG- 1 and brain. DNA Res. 3: 321- 329, 1996. ; and

[12472] Torrents, D.; Estevez, R.; Pineda, M.; Fernandez, E.; Lloberas, J.; Shi, Y.- B.; Zorzano, A.; Palacin, M. : Identification and characterization of a membrane protein (y(+)L amino acid tr.

[12473] Further studies establishing the function and utilities of SLC7A6 are found in John Hopkins OMIM database record ID 605641, and in cited publications listed in Table 5, which are hereby incorporated by reference.SMA3 (Accession NM_006780.1) is another GAM74 target gene, herein designated TARGET GENE. SMA3 BINDING SITE is a target binding site found in the 3` untranslated region of

mRNA encoded by SMA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMA3 BINDING SITE, designated SEQ ID:6849, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12474] Another function of GAM74 is therefore inhibition of SMA3 (Accession NM_006780.1) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMA3.

[12475] Sparc/osteonectin, cwcv and kazal-like domains proteoglycan (testican) (SPOCK, Accession NM_004598.2) is another GAM74 target gene, herein designated TARGET GENE. SPOCK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPOCK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPOCK BINDING SITE, designated SEQ ID:10327, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12476] Another function of GAM74 is therefore inhibition of

Sparc/osteonectin, cwcv and kazal-like domains proteoglycan (testican) (SPOCK, Accession NM_004598.2) . Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPOCK.

[12477] Thy-1 cell surface antigen (THY1, Accession NM_006288.2) is another GAM74 target gene, herein designated TARGET GENE. THY1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by THY1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of THY1 BINDING SITE, designated SEQ ID:7884, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12478] Another function of GAM74 is therefore inhibition of Thy-1 cell surface antigen (THY1, Accession NM_006288.2), a gene which plays a role in cell- cell or cell- ligand interactions during synaptogenesis. Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THY1.

[12479] The function of THY1 has been established by previous studies. Thy- 1 is the designation for a major cell surface

glycoprotein characteristic to T cells, as first defined in the mouse and rat (Raff, 1971; Letarte- Muirhead et al., 1975). The Thy- 1 glycoproteins are constituents of thymocytes and neurons and probably are involved in cell-cell interactions. The putative human homolog of Thy- 1 of the mouse is called K117. The human homolog of the rodent antigen was studied by Ades et al. (1980). Using a monoclonal antibody, McKenzie and Fabre (1981) studied the tissue distribution of the antigen. By use of a gene clone in somatic cell hybrids, Seki et al. (1985) assigned the THY1 gene to chromosome 11. Van den Elsen et al. (1985) predicted that the human Thy- 1 homolog maps to chromosome 11 because that is where they found T3D (OMIM Ref. No. 186790) to map and in the mouse T3D and Thy- 1 map to chromosome 9 along with certain other loci that are on human 11q. A multigene family is a group of homologous genes with similar function. A supergene family is a set of multigene families and single genes related by sequence (implying common ancestry) but not necessarily related in function. Hood et al. (1985) refer to the immunoglobulin supergene family which includes Thy- 1, poly- Ig receptor, heavy, kappa and lambda immunoglobulins, Lyt- 2 (T8), alpha and beta

chains of T- cell antigen receptor and the closely homologous gamma chain, class I MHC antigen, beta- 2- microglobulin, and the alpha and beta chains of class II MHC antigens. Thy- 1 is structurally the simplest of these, consisting of a single immunoglobulin homology unit that is either intermediate between V and C or somewhat more similar to a V homology unit (Williams and Gagnon, 1982). The Thy- 1 glycoprotein is also exceptional in that it is on the cell surface as a free homology unit and apparently does not associate either with itself or with other polypeptides. Its role in immune response is unclear. It is expressed on fibroblasts and brain cells in addition to some T cells. The significant role of Thy- 1 in developing nervous tissue (Morris, 1985) may be of relevance to disorders such as ataxia- telangiectasia (OMIM Ref. No. 208900) that combine neurologic and immunologic defects. By somatic cell and in situ hybridization, van Rijs et al. (1985) localized the gene to 11q23- 11q24. Rettig et al. (1985) assigned the gene to 11q13- qter, by Southern analysis of DNA from hybrid cells containing rearranged chromosomes 11. HGM7 gave the regional assignment as 11q22.3. Tunnacliffe and McGuire (1990) constructed a physical map of 11q23 by pulsed field gel electrophoresis

and showed that THY1 lies in 11q23.3 as the most telomeric of a group of 6 genes: cen- - CD3E- - CD3D- - CD3G- - PBGD- - CBL2- - THY1- - qter. Greenspan and O'Brien (1989) showed in the mouse that a factor secreted by nonneuronal accessory cells of dorsal root ganglion cultures stimulates neurite outgrowth in neonatal sympathetic ganglion neurons. They presented evidence that this is identical to Thy- 1. It is this function in separate tissues that might explain pleiotropic manifestations of some syndromes such as ataxia- telangiectasia (OMIM Ref. No. 208900) or cartilage- hair hypoplasia (OMIM Ref. No. 250250).

[12480]

[12481] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12482] Morris, R. : Thy- 1 in developing nervous tissue. Dev. Neurosci. 7: 133- 160, 1985. ; and

[12483] Greenspan, R. J.; O'Brien, M. C. : Genetic evidence for the role of Thy- 1 in neurite outgrowth in the mouse. J. Neurogenet. 5: 25- 36, 1989.

[12484] Further studies establishing the function and utilities of THY1 are found in John Hopkins OMIM database record ID

188230, and in cited publications listed in Table 5, which are hereby incorporated by reference.Upstream binding transcription factor, rna polymerase i (UBTF, Accession NM_014233.1) is another GAM74 target gene, herein designated TARGET GENE. UBTF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UBTF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBTF BINDING SITE, designated SEQ ID:14273, to the nucleotide sequence of GAM74 RNA, herein designated GAM RNA, also designated SEQ ID:254.

[12485] Another function of GAM74 is therefore inhibition of Upstream binding transcription factor, rna polymerase i (UBTF, Accession NM_014233.1), a gene which recognizes the ribosomal rna gene promoter and activates transcription. Accordingly, utilities of GAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBTF.

[12486] The function of UBTF has been established by previous studies. Upstream binding factor (UBF) is a transcription factor required for expression of the 18S, 5.8S, and 28S ribosomal RNAs, along with SL1 (a complex of TBP (OMIM

Ref. No. 600075) and multiple TBP- associated factors or 'TAFs'). Two UBF polypeptides, of 94 and 97 kD, exist in the human (Bell et al., 1988). UBF is a nucleolar phosphoprotein with both DNA binding and transactivation domains. Sequence- specific DNA binding to the core and upstream control elements of the human rRNA promoter is mediated through several HMG boxes (Jantzen et al., 1990). Jantzen et al. (1990) cloned human UBF by screening a HeLa cell cDNA library with DNA probes based on tryptic peptides of the protein. They found an open reading frame encoding the 764- amino acid UBF. The authors also characterized DNA binding characteristics of UBF. Chan et al. (1991) cloned the human cDNA by screening an expression library with a specific autoantibody that recognizes nucleolar organizing regions. Jones et al. (1995) mapped the gene, symbolized UBTF, to the BRCA1 region of 17q21 by analyzing genomic clones from that region. They found the gene order to be cen- - PPY(OMIM Ref. No. 167780)- - UBTF- - EPB3(OMIM Ref. No. 109270)- - GP2B(OMIM Ref. No. 273800)- - tel.

[12487]

[12488] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[12489] Jantzen, H.- M.; Admon, A.; Bell, S. P.; Tjian, R. : Nucleolar transcription factor hUBF contains a DNA- binding motif with homology to HMG proteins. Nature 344: 830- 836, 1990. ; and

[12490] Chan, E. K. L.; Imai, H.; Hamel, J. C.; Tan, E. M. : Human autoantibody to RNA polymerase I transcription factor hUBF: molecular identity of nucleolus organizer region autoantigen NOR- 9.

[12491] Further studies establishing the function and utilities of UBTF are found in John Hopkins OMIM database record ID 600673, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[12492] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 75 (GAM75), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12493] GAM75 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM75 was detected is described hereinabove with reference to Figs. 8-15.

[12494] GAM75 gene, herein designated GAM GENE, and GAM75 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[12495] GAM75 gene encodes a GAM75 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM75 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM75 precursor RNA is designated SEQ ID:177, and is provided hereinbelow with reference to the sequence listing part.

[12496] GAM75 precursor RNA folds onto itself, forming GAM75 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12497] GAM75 precursor RNA folds onto itself, forming GAM75 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[12498] Nucleotide sequence of GAM75 precursor RNA, designated SEQ-ID: 177, and a schematic representation of a predicted secondary folding of GAM75 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[12499] An enzyme complex designated DICER COMPLEX, `dices` the GAM75 folded precursor RNA into GAM75 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM75 RNA is designated SEQ ID:210, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[12500] GAM75 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM75 target RNA, herein designated GAM TARGET RNA. GAM75 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12501] GAM75 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM75 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM75 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM75 RNA may have a different number of target binding sites in untranslated regions of a GAM75 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an

example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12502] The complementary binding of GAM75 RNA, herein designated GAM RNA, to target binding sites on GAM75 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM75 target RNA into GAM75 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12503] It is appreciated that GAM75 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM75 target genes. The mRNA of each one of this plurality of GAM75 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM75 RNA, herein designated GAM RNA, and which when bound by GAM75 RNA causes inhibition of translation of respective one or more GAM75 target proteins.

[12504] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM75 gene, herein designated GAM GENE, on one or

more GAM75 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12505] It is appreciated that specific functions and accordingly utilities of GAM75 correlate with, and may be deduced from, the identity of the target genes which GAM75 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12506]

[12507]

[12508] Adenylate cyclase 7 (ADCY7, Accession NM_001114.1) is a GAM75 target gene, herein designated TARGET GENE. ADCY7 BINDING SITE is a target binding site found in the

3` untranslated region of mRNA encoded by ADCY7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADCY7 BINDING SITE, designated SEQ ID:15427, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12509] A function of GAM75 is therefore inhibition of Adenylate cyclase 7 (ADCY7, Accession NM_001114.1), a gene which this a membrane- bound, ca(2+)- inhibitable adenylyl cyclase. Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY7.

[12510] The function of ADCY7 has been established by previous studies. Hellevuo et al. (1993) identified a novel form of human adenylyl cyclase (ADCY7) in the human erythroleukemia cell line HEL. It appeared that ADCY7 is the major form of adenylyl cyclase in human platelets. Hellevuo et al. (1995) used PCR techniques in the study of human/rodent somatic hybrid panels and a YAC library to demonstrate that the ADCY7 gene is located on 16q12-q13. The adenylyl cyclase enzyme family is characterized by the presence of 12 membrane- spanning domains in

its sequences, and this region of the genome is known to contain other genes encoding proteins characterized by 12 membrane- spanning domains: norepinephrine transporter protein- 1 (NET1; 163970), located at 16q12.2, and renal sodium- glucose transporter- 2 (SGLT2; 182381), located at 16p11.2.

[12511]

[12512] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12513] Hellevuo, K.; Berry, R.; Sikela, J. M.; Tabakoff, B. : Localization of the gene for a novel human adenylyl cyclase (ADCY7) to chromosome 16. Hum. Genet. 95: 197- 200, 1995. ; and

[12514] Hellevuo, K.; Yoshimura, M.; Kao, M.; Hoffman, P. L.; Cooper, D. M. F.; Tabakoff, B. : A novel adenylyl cyclase sequence cloned from the human erythroleukemia cell line. Biochem. Biophy.

[12515] Further studies establishing the function and utilities of ADCY7 are found in John Hopkins OMIM database record ID 600385, and in cited publications listed in Table 5, which are hereby incorporated by reference.Blepharophimosis, epicanthus inversus and ptosis,

candidate 1 (BPESC1, Accession NM_021812.1) is another GAM75 target gene, herein designated TARGET GENE. BPESC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BPESC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BPESC1 BINDING SITE, designated SEQ ID:12031, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12516] Another function of GAM75 is therefore inhibition of Blepharophimosis, epicanthus inversus and ptosis, candidate 1 (BPESC1, Accession NM_021812.1) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BPESC1.

[12517] Chromosome 22 open reading frame 3 (C22orf3, Accession NM_012265.1) is another GAM75 target gene, herein designated TARGET GENE. C22orf3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C22orf3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of C22orf3 BINDING SITE, designated SEQ ID:12551, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12518] Another function of GAM75 is therefore inhibition of Chromosome 22 open reading frame 3 (C22orf3, Accession NM_012265.1) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf3.

[12519] CMRF-35H (Accession XM_046925.4) is another GAM75 target gene, herein designated TARGET GENE. CMRF-35H BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CMRF-35H, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CMRF-35H BINDING SITE, designated SEQ ID:5740, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12520] Another function of GAM75 is therefore inhibition of CMRF-35H (Accession XM_046925.4) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

CMRF-35H.

[12521] Camp responsive element binding protein-like 2 (CREBL2, Accession NM_001310.2) is another GAM75 target gene, herein designated TARGET GENE. CREBL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CREBL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CREBL2 BINDING SITE, designated SEQ ID:4609, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12522] Another function of GAM75 is therefore inhibition of Camp responsive element binding protein-like 2 (CREBL2, Accession NM_001310.2) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CREBL2.

[12523] D123 (Accession) is another GAM75 target gene, herein designated TARGET GENE. D123 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by D123, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of D123 BINDING SITE, designated SEQ ID:17716, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12524] Another function of GAM75 is therefore inhibition of D123 (Accession) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D123.

[12525] Endoglin (osler-rendu-weber syndrome 1) (ENG, Accession NM_000118.1) is another GAM75 target gene, herein designated TARGET GENE. ENG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ENG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ENG BINDING SITE, designated SEQ ID:2762, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12526] Another function of GAM75 is therefore inhibition of Endoglin (osler-rendu-weber syndrome 1) (ENG, Accession NM_000118.1) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENG.

[12527] FLJ14936 (Accession NM_032864.2) is another GAM75

target gene, herein designated TARGET GENE. FLJ14936 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FLJ14936, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14936 BINDING SITE, designated SEQ ID:2656, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12528] Another function of GAM75 is therefore inhibition of FLJ14936 (Accession NM_032864.2) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14936.

[12529] FLJ32332 (Accession NM_144641.1) is another GAM75 target gene, herein designated TARGET GENE. FLJ32332 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32332, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32332 BINDING SITE, designated SEQ ID:16169, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12530] Another function of GAM75 is therefore inhibition of FLJ32332 (Accession NM_144641.1) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32332.

[12531] Glucokinase (hexokinase 4, maturity onset diabetes of the young 2) (GCK, Accession NM_000162.2) is another GAM75 target gene, herein designated TARGET GENE. GCK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GCK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GCK BINDING SITE, designated SEQ ID:4463, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12532] Another function of GAM75 is therefore inhibition of Glucokinase (hexokinase 4, maturity onset diabetes of the young 2) (GCK, Accession NM_000162.2), a gene which catalyzes the initial step in utilization of glucose by the beta- cell and liver at physiological glucose concentration. Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCK.

[12533] The function of GCK has been established by previous studies. B lymphocytes that reside in the germinal center of lymphoid follicles are functionally and phenotypically distinct from those residing in the surrounding mantle zone. Various regulatory and structural genes control a complex series of differentiation and selection steps through which B cells that exit the germinal center of lymphoid follicles must pass. In differential hybridization studies to identify some of these genes, Katz et al. (1994) isolated a novel gene based on its preferential expression in tonsillar germinal center B lymphocytes. The complete nucleotide sequence predicted a 819- amino acid protein, named GC (for 'germinal center') kinase, with homology to serine- threonine protein kinases. Its catalytic domain was 39% and 37% identical to those of S. cerevisiae STE20 and Drosophila NinaC proteins, respectively. Northern blot analysis revealed expression of a 2.9- kb mRNA in several human tissues, including brain, lung, and placenta. In situ hybridization of tonsil tissue demonstrated preferential hybridization to the germinal center region. The expressed protein phosphorylated casein and myelin basic protein in in vitro kinase assays. Pombo et al. (1995) showed that GC kinase, or GCK, specifically activates the

SAPK (OMIM Ref. No. 601335) pathway. They also showed that GCK is activated in situ by TNF- alpha (OMIM Ref. No. 191160), a potent SAPK agonist. The authors suggested that the SAPK pathway may be active in the differentiation and selection of B cells in the germinal center

[12534]

[12535] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12536] Katz, P.; Whalen, G.; Kehrl, J. H. : Differential expression of a novel protein kinase in human B lymphocytes: preferential localization in the germinal center. J. Biol. Chem. 269: 16802- 16809, 1994. ; and

[12537] Ren, M.; Zeng, J.; De Lemos- Chiarandini, C.; Rosenfeld, M.; Adesnik, M.; Sabatini, D. D. : In its active form, the GTP- binding protein rab8 interacts with a stress- activated protein kina.

[12538] Further studies establishing the function and utilities of GCK are found in John Hopkins OMIM database record ID 603166, and in cited publications listed in Table 5, which are hereby incorporated by reference.Golgi reassembly stacking protein 1, 65kda (GORASP1, Accession NM_031899.2) is another GAM75 target gene, herein des-

ignated TARGET GENE. GORASP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GORASP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GORASP1 BINDING SITE, designated SEQ ID:17619, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12539] Another function of GAM75 is therefore inhibition of Golgi reassembly stacking protein 1, 65kda (GORASP1, Accession NM_031899.2), a gene which has some funtion with the Golgi apparatus. Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GORASP1.

[12540] The function of GORASP1 has been established by previous studies. Barr et al. (1998) determined that GOLPH5 interacts with GM130 (OMIM Ref. No. 602580), a Golgi matrix protein, in detergent extracts of rat liver Golgi membranes. They further determined that this complex can bind to the vesicle docking protein p115 (OMIM Ref. No. 603344). Using in vitro translation and site- directed mutagenesis in conjunction with immunoprecipitation, Barr et

al. (1998) localized the critical interacting domains to the C terminus of GM130 and the PDZ- like domain of GOLPH5. Interaction was also found to be critical for the correct targeting of both proteins to the Golgi apparatus. Sutterlin et al. (2002) found that addition of an antibody to the Golgi- associated protein GRASP65 inhibited Golgi fragmentation by mitotic cytosol in permeabilized cells. Microinjecting this antibody or a C- terminal fragment of GRASP65 containing the antibody- binding site into normal rat kidney cells prevented entry into mitosis. Under these conditions the cells had completed S phase but were not in the prophase stage of mitosis. Fragmentation of the Golgi apparatus by nocodazole or brefeldin A treatment prior to or after microinjection of the anti- GRASP65 antibody alleviated the block in mitotic entry. These data suggested that pericentriolar Golgi organization is a sensor for controlling entry into mitosis in mammalian cells.

[12541]

[12542] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12543] Barr, F. A.; Nakamura, N.; Warren, G. : Mapping the interaction between GRASP65 and GM130, components of a

protein complex involved in the stacking of Golgi cisternae. EMBO J. 17: 3258- 3268, 1998. ; and

[12544] Sutterlin, C.; Hsu, P.; Mallabiabarrena, A.; Malhotra, V. : Fragmentation and dispersal of the pericentriolar Golgi complex is required for entry into mitosis in mammalian cells. Cell 1.

[12545] Further studies establishing the function and utilities of GORASP1 are found in John Hopkins OMIM database record ID 606867, and in cited publications listed in Table 5, which are hereby incorporated by reference.LANP-L (Accession) is another GAM75 target gene, herein designated TARGET GENE. LANP-L BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LANP-L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LANP-L BINDING SITE, designated SEQ ID:11358, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12546] Another function of GAM75 is therefore inhibition of LANP-L (Accession) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with LANP-L.

[12547] LOC143098 (Accession) is another GAM75 target gene, herein designated TARGET GENE. LOC143098 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC143098, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC143098 BINDING SITE, designated SEQ ID:1402, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12548] Another function of GAM75 is therefore inhibition of LOC143098 (Accession) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143098.

[12549] LOC145988 (Accession XM_085290.7) is another GAM75 target gene, herein designated TARGET GENE. LOC145988 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC145988, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145988 BINDING SITE, designated SEQ ID:14081, to

the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12550] Another function of GAM75 is therefore inhibition of LOC145988 (Accession XM_085290.7) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145988.

[12551] LOC199936 (Accession) is another GAM75 target gene, herein designated TARGET GENE. LOC199936 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC199936, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC199936 BINDING SITE, designated SEQ ID:13578, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12552] Another function of GAM75 is therefore inhibition of LOC199936 (Accession) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199936.

[12553] LOC221583 (Accession) is another GAM75 target gene, herein designated TARGET GENE. LOC221583 BINDING

SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221583, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221583 BINDING SITE, designated SEQ ID:3621, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12554] Another function of GAM75 is therefore inhibition of LOC221583 (Accession) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221583.

[12555] LOC256310 (Accession) is another GAM75 target gene, herein designated TARGET GENE. LOC256310 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC256310, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256310 BINDING SITE, designated SEQ ID:5809, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12556] Another function of GAM75 is therefore inhibition of

LOC256310 (Accession) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256310.

[12557] LOC93349 (Accession NM_138402.2) is another GAM75 target gene, herein designated TARGET GENE. LOC93349 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC93349, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC93349 BINDING SITE, designated SEQ ID:4761, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12558] Another function of GAM75 is therefore inhibition of LOC93349 (Accession NM_138402.2) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93349.

[12559] Matrix metalloproteinase 13 (collagenase 3) (MMP13, Accession NM_002427.2) is another GAM75 target gene, herein designated TARGET GENE. MMP13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MMP13, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MMP13 BINDING SITE, designated SEQ ID:15931, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12560] Another function of GAM75 is therefore inhibition of Matrix metalloproteinase 13 (collagenase 3) (MMP13, Accession NM_002427.2) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP13.

[12561] Oxysterol binding protein-like 5 (OSBPL5, Accession NM_145638.1) is another GAM75 target gene, herein designated TARGET GENE. OSBPL5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by OSBPL5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OSBPL5 BINDING SITE, designated SEQ ID:10114, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12562] Another function of GAM75 is therefore inhibition of

Oxysterol binding protein-like 5 (OSBPL5, Accession NM_145638.1) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL5.

[12563] Rad52 homolog (s. cerevisiae) (RAD52, Accession NM_002879.2) is another GAM75 target gene, herein designated TARGET GENE. RAD52 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RAD52, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAD52 BINDING SITE, designated SEQ ID:8804, to the nucleotide sequence of GAM75 RNA, herein designated GAM RNA, also designated SEQ ID:210.

[12564] Another function of GAM75 is therefore inhibition of Rad52 homolog (s. cerevisiae) (RAD52, Accession NM_002879.2) . Accordingly, utilities of GAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD52.

[12565]

[12566] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, re-

ferred to here as Genomic Address Messenger 76 (GAM76), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12567] GAM76 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM76 was detected is described hereinabove with reference to Figs. 8-15.

[12568] GAM76 gene, herein designated GAM GENE, and GAM76 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[12569] GAM76 gene encodes a GAM76 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM76 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM76 precursor RNA is designated SEQ ID:129, and is provided hereinbelow with reference to the sequence listing part.

[12570] GAM76 precursor RNA folds onto itself, forming GAM76 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12571] GAM76 precursor RNA folds onto itself, forming GAM76 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[12572] Nucleotide sequence of GAM76 precursor RNA, designated SEQ-ID: 129, and a schematic representation of a predicted secondary folding of GAM76 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[12573] An enzyme complex designated DICER COMPLEX, `dices` the GAM76 folded precursor RNA into GAM76 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM76 RNA is designated SEQ ID:292, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[12574] GAM76 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM76 target RNA, herein designated GAM TARGET RNA. GAM76 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12575] GAM76 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM76 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM76 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such

target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM76 RNA may have a different number of target binding sites in untranslated regions of a GAM76 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12576] The complementary binding of GAM76 RNA, herein designated GAM RNA, to target binding sites on GAM76 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM76 target RNA into GAM76 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12577] It is appreciated that GAM76 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM76 target genes. The mRNA of each one of this plurality of GAM76 target genes comprises one or more target binding sites, each having a nucleotide sequence

which is at least partly complementary to GAM76 RNA, herein designated GAM RNA, and which when bound by GAM76 RNA causes inhibition of translation of respective one or more GAM76 target proteins.

[12578] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM76 gene, herein designated GAM GENE, on one or more GAM76 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12579] It is appreciated that specific functions and accordingly utilities of GAM76 correlate with, and may be deduced from, the identity of the target genes which GAM76 binds

and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12580]

[12581]

[12582] Rho guanine nucleotide exchange factor (gef) 5 (ARHGEF5, Accession NM_005435.2) is a GAM76 target gene, herein designated TARGET GENE. ARHGEF5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHGEF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ARHGEF5 BINDING SITE, designated SEQ ID:1425, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12583] A function of GAM76 is therefore inhibition of Rho guanine nucleotide exchange factor (gef) 5 (ARHGEF5, Accession NM_005435.2), a gene which may form complex with G proteins and stimulate Rho- dependent signals. Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF5.

[12584] The function of ARHGEF5 has been established by previous studies. Chan et al. (1994) isolated the TIM oncogene by an expression cloning strategy (Miki et al., 1991) as a cDNA clone with transforming activity in NIH/3T3 fibroblasts. The 2.3- kb TIM cDNA encodes a predicted protein of 60- kD containing a Dbl- homology (DH) domain. The DH motif is shared by several signal transducing molecules that are implicated as regulators of small GTP-binding proteins. Therefore, the TIM oncogene is also thought to be involved in the control of cytoskeletal organization through regulation of small GTP- binding proteins. Using human/hamster somatic cell hybrids, Chan et al. (1994) mapped the TIM gene to chromosome 7. By fluorescence in situ hybridization, Takai et al. (1995) localized the gene to 7q33- q35.

[12585]

[12586] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12587] Chan, A. M- L.; McGovern, E. S.; Catalano, G.; Fleming, T. P.; Miki, T. : Expression cDNA cloning of a novel oncogene with sequence similarity to regulators of small GTP- binding proteins. Oncogene 9: 1057- 1063, 1994. ; and

[12588] Miki, T.; Fleming, T. P.; Crescenzi, M.; Molloy, C. J.; Blam, S. B.; Reynolds, S. H.; Aaronson, S. A. : Development of a highly efficient expression cDNA cloning system: application to.

[12589] Further studies establishing the function and utilities of ARHGEF5 are found in John Hopkins OMIM database record ID 600888, and in cited publications listed in Table 5, which are hereby incorporated by reference.Cholinergic receptor, nicotinic, beta polypeptide 4 (CHRNB4, Accession NM_000750.1) is another GAM76 target gene, herein designated TARGET GENE. CHRNB4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CHRNB4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CHRNB4 BINDING SITE, designated SEQ ID:13256, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12590] Another function of GAM76 is therefore inhibition of Cholinergic receptor, nicotinic, beta polypeptide 4 (CHRNB4, Accession NM_000750.1), a gene which mediates fast signal transmission at synapses. Accordingly,

utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRNB4.

[12591] The function of CHRNB4 has been established by previous studies. Transmitter- gated cation channels are detectors of excitatory chemical signals at synapses in the nervous system. Khakh et al. (2000) showed that structurally distinct alpha- 3- beta- 4 nicotinic and P2X(2) (OMIM Ref. No. 600844) channels influence each other when coactivated. The activation of one channel type affects distinct kinetic and conductance states of the other, and coactivation results in nonadditive responses owing to inhibition of both channel types. State- dependent inhibition of nicotinic channels was revealed most clearly with mutant P2X(2) channels, and inhibition was decreased at lower densities of channel expression. In synaptically coupled myenteric neurons, nicotinic fast excitatory postsynaptic currents were occluded during activation of endogenously coexpressed P2X channels. Khakh et al. (2000) concluded that their data provide a molecular basis and a synaptic context for cross- inhibition between transmitter- gated channels. Transmitter- gated cation channels are detectors of excitatory chemical signals at synapses in the ner-

vous system. Khakh et al. (2000) showed that structurally distinct alpha- 3- beta- 4 nicotinic and P2X(2) (OMIM Ref. No. 600844) channels influence each other when coactivated. The activation of one channel type affects distinct kinetic and conductance states of the other, and coactivation results in nonadditive responses owing to inhibition of both channel types. State- dependent inhibition of nicotinic channels was revealed most clearly with mutant P2X(2) channels, and inhibition was decreased at lower densities of channel expression. [12596] Further studies establishing the function and utilities of CHRNB4 are found in John Hopkins OMIM database record ID 118509, and in cited publications listed in Table 5, which are hereby incorporated by reference.FLJ10450 (Accession NM_018095.2) is another GAM76 target gene, herein designated TARGET GENE. FLJ10450 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ10450, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10450 BINDING SITE, designated SEQ ID:15495, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12597] Another function of GAM76 is therefore inhibition of FLJ10450 (Accession NM_018095.2) . Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10450.

[12598] FLJ21977 (Accession NM_032213.2) is another GAM76

target gene, herein designated TARGET GENE. FLJ21977 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21977, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21977 BINDING SITE, designated SEQ ID:15840, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12599] Another function of GAM76 is therefore inhibition of FLJ21977 (Accession NM_032213.2) . Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21977.

[12600] Huntingtin (huntington disease) (HD, Accession NM_002111.3) is another GAM76 target gene, herein designated TARGET GENE. HD BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:4994, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12601] Another function of GAM76 is therefore inhibition of Huntingtin (huntington disease) (HD, Accession NM_002111.3) . Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD.

[12602] KIAA0513 (Accession NM_014732.1) is another GAM76 target gene, herein designated TARGET GENE. KIAA0513 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0513, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:7751, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12603] Another function of GAM76 is therefore inhibition of KIAA0513 (Accession NM_014732.1) . Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513.

[12604] KIAA1328 (Accession XM_029429.5) is another GAM76 target gene, herein designated TARGET GENE. KIAA1328 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by KIAA1328, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1328 BINDING SITE, designated SEQ ID:9539, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12605] Another function of GAM76 is therefore inhibition of KIAA1328 (Accession XM_029429.5) . Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1328.

[12606] LOC144305 (Accession) is another GAM76 target gene, herein designated TARGET GENE. LOC144305 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144305, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144305 BINDING SITE, designated SEQ ID:17369, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12607] Another function of GAM76 is therefore inhibition of

LOC144305 (Accession) . Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144305.

[12608] LOC146310 (Accession NM_174903.1) is another GAM76 target gene, herein designated TARGET GENE. LOC146310 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146310, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146310 BINDING SITE, designated SEQ ID:16285, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12609] Another function of GAM76 is therefore inhibition of LOC146310 (Accession NM_174903.1) . Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146310.

[12610] LOC148223 (Accession) is another GAM76 target gene, herein designated TARGET GENE. LOC148223 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC148223, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148223 BINDING SITE, designated SEQ ID:12443, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12611] Another function of GAM76 is therefore inhibition of LOC148223 (Accession) . Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148223.

[12612] LOC162417 (Accession) is another GAM76 target gene, herein designated TARGET GENE. LOC162417 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC162417, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC162417 BINDING SITE, designated SEQ ID:9518, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12613] Another function of GAM76 is therefore inhibition of LOC162417 (Accession) . Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162417.

[12614] LOC220565 (Accession) is another GAM76 target gene, herein designated TARGET GENE. LOC220565 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC220565, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC220565 BINDING SITE, designated SEQ ID:18814, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12615] Another function of GAM76 is therefore inhibition of LOC220565 (Accession) . Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220565.

[12616] LOC254778 (Accession) is another GAM76 target gene, herein designated TARGET GENE. LOC254778 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC254778, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254778 BINDING SITE, designated SEQ ID:18587, to the nucleotide sequence of GAM76 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:292.

[12617] Another function of GAM76 is therefore inhibition of LOC254778 (Accession) . Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254778.

[12618] Lysophospholipase ii (LYPLA2, Accession NM_007260.2) is another GAM76 target gene, herein designated TARGET GENE. LYPLA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LYPLA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LYPLA2 BINDING SITE, designated SEQ ID:2075, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12619] Another function of GAM76 is therefore inhibition of Lysophospholipase ii (LYPLA2, Accession NM_007260.2) . Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LYPLA2.

[12620] Proteinase 3 (serine proteinase, neutrophil, wegener granulomatosis autoantigen) (PRTN3, Accession NM_002777.2) is another GAM76 target gene, herein designated TARGET

GENE. PRTN3 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRTN3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRTN3 BINDING SITE, designated SEQ ID:15181, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12621] Another function of GAM76 is therefore inhibition of Proteinase 3 (serine proteinase, neutrophil, wegener granulomatosis autoantigen) (PRTN3, Accession NM_002777.2), a gene which is a neutrophil serine protease. and therefore may be associated with Wegener granulomatosis. Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of Wegener granulomatosis, and of other diseases and clinical conditions associated with PRTN3.

[12622] The function of PRTN3 has been established by previous studies. Wegener granulomatosis is a disease of unknown cause and pathogenesis. Its major features are necrotizing granulomatous lesions, which most often affect the upper and lower airways and are associated with vasculitis, necrotizing glomerulonephritis, and pulmonary capillaritis. It is a devastating illness; without immunosuppressive

therapy, over 80% of patients die within 1 year, often because of rapid loss of renal function or massive pulmonary hemorrhage. Definitive diagnosis hitherto depended on demonstration of characteristic histologic findings. Beginning with the report of Davies et al. (1982), detection of antineutrophil antibodies provided an immunologic diagnosis. Niles et al. (1989) demonstrated that the circulating IgG autoantibodies that produced a cytoplasmic pattern of staining in neutrophils from 10 patients with Wegener granulomatosis reacted, in Western blot analysis, with a 29- kD neutrophil protein (P29), which has the characteristics of a distinctive serine proteinase. Ludemann et al. (1990) showed further that the antigen is a neutral serine protease that is able to cleave elastin and that it is identical to proteinase- 3. The neutral serine protease called proteinase- 3 (PR3) was isolated, identified, and characterized from polymorphonuclear leukocytes by Kao et al. (1988). They showed that PR3 has an ability to induce emphysema in hamsters commensurate with that of leukocyte elastase. Lutz et al. (2000) showed that myeloblastin is expressed specifically in immature myeloid cells, that myeloblastin is a granulocyte colony- stimulating factor (G- CSF)- responsive gene, and that its constitutive over-

expression confers factor- independent growth to Ba/F3 cells expressing the G- CFS receptor. Lutz et al. (2000) suggested that their results point to myeloblastin as a G-CSF- responsive gene critical to factor- independent growth and indicate that the expression of the G- CSF receptor is a prerequisite to this process. A 91- bp myeloblastin promoter region containing binding sites for PU.1 (OMIM Ref. No. 165170), C/EBP (OMIM Ref. No. 116897), and c- Myb (OMIM Ref. No. 189990) is responsive to G- CSF treatment. Although PU.1, C/EBP, and c-Myb transcription factors all were critical for expression of myeloblastin, its upregulation by G- CSF was associated mainly with PU.1. Lutz et al. (2000) concluded that myeloblastin is an important target of PU.1 and a key protease for factor- independent growth of hematopoietic cells. Using RT- PCR, immunoblot, and immunofluorescence microscopy analyses, Sugawara et al. (2001) demonstrated that oral epithelial cells express IL18 (OMIM Ref. No. 600953) mRNA and the 24- kD IL18 precursor protein. ELISA analysis showed that stimulation of the cells with PRTN3 and lipopolysaccharide (LPS) after gamma- interferon (IFNG; 147570) priming leads to intracellular production and secretion of the 18- kD bioactive

form of IL18 in a caspase- 1 (CASP1; 147678)- independent fashion. Cell fractionation and immunoblot analyses indicated that PRTN3 acts on the cell surface after the IFNG priming, not intracellularly. Sugawara et al. (2001) proposed that PRTN3 together with LPS and IFNG may be involved in mucosal inflammation, such as periodontitis.

[12623]

[12624] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12627] Further studies establishing the function and utilities of PRTN3 are found in John Hopkins OMIM database record ID 177020, and in cited publications listed in Table 5, which are hereby incorporated by reference.SC65

(Accession NM_006455.1) is another GAM76 target gene, herein designated TARGET GENE. SC65 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SC65, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SC65 BINDING SITE, designated SEQ ID:6668, to the nucleotide sequence of GAM76 RNA, herein designated GAM RNA, also designated SEQ ID:292.

[12628] Another function of GAM76 is therefore inhibition of SC65 (Accession NM_006455.1) . Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SC65.

[12629] Smoothelin (SMTN, Accession NM_134269.1) is another GAM76 target gene, herein designated TARGET GENE. SMTN BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SMTN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SMTN BINDING SITE, designated SEQ ID:16350, to the nucleotide sequence of GAM76 RNA,

herein designated GAM RNA, also designated SEQ ID:292.

[12630] Another function of GAM76 is therefore inhibition of Smoothelin (SMTN, Accession NM_134269.1), a gene which is a structural protein. Accordingly, utilities of GAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMTN.

[12631] The function of SMTN has been established by previous studies. Van der Loop et al. (1996) used expression cloning to isolate a novel gene whose expression is restricted to smooth muscle cells. This gene, termed smoothelin (SMTN), encodes a 371- amino acid polypeptide. Sequence analysis revealed that the protein contains a 56- amino acid domain with significant homology to a sequence that flanks the actin- binding domains of dystrophin, utrophin, beta- spectrin, and alpha- actinin. Cell fractionation studies suggested to the authors that smoothelin is a part of the cytoskeleton. By Northern blot analysis, van der Loop et al. (1996) showed that the gene is expressed as a 1.5- kb mRNA in several tissues containing smooth muscle, but not in brain, adipose tissue, cardiac muscle, or skeletal muscle. Transfection of the human cDNA into smooth muscle cells or COS- 7 cells produced a 59- kD protein that assembled into a filamen-

tous network. Subcellular localization showed that smoothelin is associated with stress fibers. Van der Loop et al. (1996) found that smoothelin is not detected in primary or long- term smooth muscle cell cultures. They also found that transcription of smoothelin is halted in smooth muscle explants.

[12632]

[12633] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12634] van der Loop, F. T. L.; Schaart, G.; Timmer, E. D. J.; Ramaekers, F. C. S.; van Eys, G. J. J. M. : Smoothelin, a novel cytoskeletal protein specific for smooth muscle cells. J. Cell Biol. 134: 401- 411, 1996. ; and

[12635] Engelen, J. J. M.; Esterling, L. E.; Albrechts, J. C. M.; Detera- Wadleigh, S. D.; van Eys, G. J. J. M. : Assignment of the human gene for smoothelin (SMTN) to chromosome 22q12 by fluores.

[12636] Further studies establishing the function and utilities of SMTN are found in John Hopkins OMIM database record ID 602127, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[12637] Fig. 8 further provides a conceptual description of a novel

bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 77 (GAM77), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12638] GAM77 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM77 was detected is described hereinabove with reference to Figs. 8-15.

[12639] GAM77 gene, herein designated GAM GENE, and GAM77 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[12640] GAM77 gene encodes a GAM77 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM77 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM77 precursor RNA is designated SEQ ID:123, and is provided hereinbelow with reference to the sequence listing part.

[12641] GAM77 precursor RNA folds onto itself, forming GAM77 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12642] GAM77 precursor RNA folds onto itself, forming GAM77 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[12643] Nucleotide sequence of GAM77 precursor RNA, designated SEQ-ID: 123, and a schematic representation of a predicted secondary folding of GAM77 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[12644] An enzyme complex designated DICER COMPLEX, `dices` the GAM77 folded precursor RNA into GAM77 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA

segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM77 RNA is designated SEQ ID:390, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[12645] GAM77 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM77 target RNA, herein designated GAM TARGET RNA. GAM77 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12646] GAM77 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM77 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM77 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target

binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM77 RNA may have a different number of target binding sites in untranslated regions of a GAM77 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12647] The complementary binding of GAM77 RNA, herein designated GAM RNA, to target binding sites on GAM77 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM77 target RNA into GAM77 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12648] It is appreciated that GAM77 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM77 target genes. The mRNA of each one of this plurality of GAM77 target genes comprises one or more tar-

get binding sites, each having a nucleotide sequence which is at least partly complementary to GAM77 RNA, herein designated GAM RNA, and which when bound by GAM77 RNA causes inhibition of translation of respective one or more GAM77 target proteins.

[12649] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM77 gene, herein designated GAM GENE, on one or more GAM77 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12650] It is appreciated that specific functions and accordingly utilities of GAM77 correlate with, and may be deduced

from, the identity of the target genes which GAM77 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12651]

[12652]

[12653] FLJ12595 (Accession NM_024994.1) is a GAM77 target gene, herein designated TARGET GENE. FLJ12595 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12595, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12595 BINDING SITE, designated SEQ ID:16765, to the nucleotide sequence of GAM77 RNA, herein designated GAM RNA, also designated SEQ ID:390.

[12654] A function of GAM77 is therefore inhibition of FLJ12595 (Accession NM_024994.1) . Accordingly, utilities of GAM77 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12595.

[12655] LOC149711 (Accession) is another GAM77 target gene, herein designated TARGET GENE. LOC149711 BINDING SITE is a target binding site found in the 5` untranslated

region of mRNA encoded by LOC149711, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149711 BINDING SITE, designated SEQ ID:17357, to the nucleotide sequence of GAM77 RNA, herein designated GAM RNA, also designated SEQ ID:390.

[12656] Another function of GAM77 is therefore inhibition of LOC149711 (Accession) . Accordingly, utilities of GAM77 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149711.

[12657] Related ras viral (r-ras) oncogene homolog (RRAS, Accession NM_006270.2) is another GAM77 target gene, herein designated TARGET GENE. RRAS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RRAS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RRAS BINDING SITE, designated SEQ ID:7350, to the nucleotide sequence of GAM77 RNA, herein designated GAM RNA, also designated SEQ ID:390.

[12658] Another function of GAM77 is therefore inhibition of Related ras viral (r-ras) oncogene homolog (RRAS, Accession

NM_006270.2) . Accordingly, utilities of GAM77 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRAS.

[12659] Solute carrier family 26, member 7 (SLC26A7, Accession NM_052832.2) is another GAM77 target gene, herein designated TARGET GENE. SLC26A7 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SLC26A7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC26A7 BINDING SITE, designated SEQ ID:8226, to the nucleotide sequence of GAM77 RNA, herein designated GAM RNA, also designated SEQ ID:390.

[12660] Another function of GAM77 is therefore inhibition of Solute carrier family 26, member 7 (SLC26A7, Accession NM_052832.2) . Accordingly, utilities of GAM77 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A7.

[12661]

[12662] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 78

(GAM78), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12663] GAM78 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM78 was detected is described hereinabove with reference to Figs. 8-15.

[12664] GAM78 gene, herein designated GAM GENE, and GAM78 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[12665] GAM78 gene encodes a GAM78 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM78 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM78 precursor RNA is designated SEQ ID:119, and is provided hereinbelow with reference to the sequence listing part.

[12666] GAM78 precursor RNA folds onto itself, forming GAM78 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12667] GAM78 precursor RNA folds onto itself, forming GAM78 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[12668] Nucleotide sequence of GAM78 precursor RNA, designated SEQ-ID: 119, and a schematic representation of a predicted secondary folding of GAM78 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[12669] An enzyme complex designated DICER COMPLEX, `dices` the GAM78 folded precursor RNA into GAM78 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA

segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM78 RNA is designated SEQ ID:277, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[12670] GAM78 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM78 target RNA, herein designated GAM TARGET RNA. GAM78 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12671] GAM78 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM78 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM78 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING

SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM78 RNA may have a different number of target binding sites in untranslated regions of a GAM78 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12672] The complementary binding of GAM78 RNA, herein designated GAM RNA, to target binding sites on GAM78 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM78 target RNA into GAM78 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12673] It is appreciated that GAM78 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM78 target genes. The mRNA of each one of this plurality of GAM78 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM78 RNA,

herein designated GAM RNA, and which when bound by GAM78 RNA causes inhibition of translation of respective one or more GAM78 target proteins.

[12674] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM78 gene, herein designated GAM GENE, on one or more GAM78 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12675] It is appreciated that specific functions and accordingly utilities of GAM78 correlate with, and may be deduced from, the identity of the target genes which GAM78 binds and inhibits, and the function of these target genes, as

elaborated hereinbelow.

[12676]

[12677]

[12678] Golgi snap receptor complex member 2 (GOSR2, Accession NM_054022.1) is a GAM78 target gene, herein designated TARGET GENE. GOSR2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GOSR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GOSR2 BINDING SITE, designated SEQ ID:5872, to the nucleotide sequence of GAM78 RNA, herein designated GAM RNA, also designated SEQ ID:277.

[12679] A function of GAM78 is therefore inhibition of Golgi snap receptor complex member 2 (GOSR2, Accession NM_054022.1), a gene which involves in transport of proteins from the cis/medial- golgi to the trans- golgi network. Accordingly, utilities of GAM78 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOSR2.

[12680] The function of GOSR2 has been established by previous

studies. In eukaryotic cells, the Golgi apparatus receives newly synthesized proteins from the endoplasmic reticulum (ER) and delivers them, after covalent modification, to their destination in the cell. These proteins move from the inside (cis) face of the Golgi to the plasma- membrane (trans) side, through a stack of cisternae, towards the trans- Golgi network (TGN). The specificity of membrane transport reactions is thought to be determined by correct pairing of vesicle- associated SNAREs (v- SNAREs) with those on the target membrane (t- SNAREs). This complex then recruits soluble NSF attachment proteins (SNAPs) and N- ethylmaleimide- sensitive factor (NSF; 601633) to form a 20S SNARE complex. See SNAPA (OMIM Ref. No. 603215). Hay et al. (1997) isolated a rat liver protein complex representing an intermediate in ER- to- Golgi transfer reactions. The complex contained the proposed cis- Golgi vesicle receptor syntaxin- 5 (OMIM Ref. No. 603189), a 28- kD Golgi- associated SNARE (GOS28 or GS28; 604026), rat homologs of the yeast Bet1 (OMIM Ref. No. 605456) and Sly1 proteins, and 2 novel proteins, sec22b (OMIM Ref. No. 604029) and a 25- kD protein. The authors called the 25- kD protein 'membrin' to show its membership in a large complex of related proteins and

to emphasize its probable importance to the trafficking of intracellular membranes. Like GOS28, syntaxin- 5, sec22b, and rat bet1, membrin is a C terminal- anchored, cytoplasmically oriented integral membrane protein. By immunofluorescence of mammalian cells expressing epitope- tagged membrin, Hay et al. (1997) found that the expressed protein accumulated primarily at the ER in half the cells, and primarily in the Golgi in the remaining cells. Other members of the complex localized to Golgi membranes, so that the complex appeared to recapitulate vesicle docking interactions of proteins originating from distinct compartments. Lowe et al. (1997) identified cDNAs encoding human, mouse, and rat membrin, which they named GS27 (Golgi SNARE of 27 kD). Immunofluorescence of mammalian cells revealed that endogenous GS27 was associated with the Golgi apparatus and its surrounding vesicular structures. Using an in vitro transport assay, the authors demonstrated that GS27 participated in protein movement from the medial- to trans- Golgi and the trans- Golgi network, but unlike GS28, GS27 had no effect on transport from the ER to the cis/medial- Golgi. They concluded that protein movement through the Golgi apparatus depends on SNARE- mediated vesicular trans-

port.

[12681]

[12682] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12683] Hay, J. C.; Chao, D. S.; Kuo, C. S.; Scheller, R. H. : Protein interactions regulating vesicle transport between the endoplasmic reticulum and Golgi apparatus in mammalian cells. Cell 89: 149- 158, 1997. ; and

[12684] Lowe, S. L.; Peter, F.; Subramaniam, V. N.; Wong, S. H.; Hong, W. : A SNARE involved in protein transport through the Golgi apparatus. Nature 389: 881- 884, 1997.

[12685] Further studies establishing the function and utilities of GOSR2 are found in John Hopkins OMIM database record ID 604027, and in cited publications listed in Table 5, which are hereby incorporated by reference.Mitochondrial ribosomal protein l13 (MRPL13, Accession NM_014078.3) is another GAM78 target gene, herein designated TARGET GENE. MRPL13 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MRPL13, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of MRPL13 BINDING SITE, designated SEQ ID:11681, to the nucleotide sequence of GAM78 RNA, herein designated GAM RNA, also designated SEQ ID:277.

[12686] Another function of GAM78 is therefore inhibition of Mitochondrial ribosomal protein l13 (MRPL13, Accession NM_014078.3) . Accordingly, utilities of GAM78 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL13.

[12687]

[12688] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 79 (GAM79), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12689] GAM79 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM79 was detected is described hereinabove with reference to Figs. 8-15.

[12690] GAM79 gene, herein designated GAM GENE, and GAM79 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[12691] GAM79 gene encodes a GAM79 precursor RNA, herein

designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM79 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM79 precursor RNA is designated SEQ ID:200, and is provided hereinbelow with reference to the sequence listing part.

[12692] GAM79 precursor RNA folds onto itself, forming GAM79 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12693] GAM79 precursor RNA folds onto itself, forming GAM79 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[12694] Nucleotide sequence of GAM79 precursor RNA, designated SEQ-ID: 200, and a schematic representation of a predicted secondary folding of GAM79 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[12695] An enzyme complex designated DICER COMPLEX, `dices` the GAM79 folded precursor RNA into GAM79 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM79 RNA is designated SEQ ID:352, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[12696] GAM79 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM79 target RNA, herein designated GAM TARGET RNA. GAM79 target RNA comprises three regions, as is typical of mRNA of a

protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12697] GAM79 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM79 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM79 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM79 RNA may have a different number of target binding sites in untranslated regions of a GAM79 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12698] The complementary binding of GAM79 RNA, herein desig-

nated GAM RNA, to target binding sites on GAM79 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM79 target RNA into GAM79 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12699] It is appreciated that GAM79 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM79 target genes. The mRNA of each one of this plurality of GAM79 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM79 RNA, herein designated GAM RNA, and which when bound by GAM79 RNA causes inhibition of translation of respective one or more GAM79 target proteins.

[12700] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM79 gene, herein designated GAM GENE, on one or more GAM79 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary bind-

ing site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12701] It is appreciated that specific functions and accordingly utilities of GAM79 correlate with, and may be deduced from, the identity of the target genes which GAM79 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12702]

[12703]

[12704] FLJ11370 (Accession NM_024961.1) is a GAM79 target gene, herein designated TARGET GENE. FLJ11370 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11370, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11370

BINDING SITE, designated SEQ ID:18758, to the nucleotide sequence of GAM79 RNA, herein designated GAM RNA, also designated SEQ ID:352.

[12705] A function of GAM79 is therefore inhibition of FLJ11370 (Accession NM_024961.1) . Accordingly, utilities of GAM79 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11370.

[12706] Neuronal pentraxin receptor (NPTXR, Accession NM_058178.1) is another GAM79 target gene, herein designated TARGET GENE. NPTXR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NPTXR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NPTXR BINDING SITE, designated SEQ ID:16236, to the nucleotide sequence of GAM79 RNA, herein designated GAM RNA, also designated SEQ ID:352.

[12707] Another function of GAM79 is therefore inhibition of Neuronal pentraxin receptor (NPTXR, Accession NM_058178.1) . Accordingly, utilities of GAM79 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTXR.

[12708]

[12709] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 80 (GAM80), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12710] GAM80 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM80 was detected is described hereinabove with reference to Figs. 8-15.

[12711] GAM80 gene, herein designated GAM GENE, and GAM80 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[12712] GAM80 gene encodes a GAM80 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM80 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM80 precursor RNA is designated SEQ ID:116, and is provided hereinbelow with reference to the sequence listing part.

[12713] GAM80 precursor RNA folds onto itself, forming GAM80

folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12714] GAM80 precursor RNA folds onto itself, forming GAM80 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[12715] Nucleotide sequence of GAM80 precursor RNA, designated SEQ-ID: 116, and a schematic representation of a predicted secondary folding of GAM80 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[12716] An enzyme complex designated DICER COMPLEX, `dices`

the GAM80 folded precursor RNA into GAM80 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM80 RNA is designated SEQ ID:362, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[12717] GAM80 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM80 target RNA, herein designated GAM TARGET RNA. GAM80 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12718] GAM80 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM80 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM80

RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM80 RNA may have a different number of target binding sites in untranslated regions of a GAM80 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12719] The complementary binding of GAM80 RNA, herein designated GAM RNA, to target binding sites on GAM80 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM80 target RNA into GAM80 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12720] It is appreciated that GAM80 target gene, herein designated TARGET GENE, in fact represents a plurality of

GAM80 target genes. The mRNA of each one of this plurality of GAM80 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM80 RNA, herein designated GAM RNA, and which when bound by GAM80 RNA causes inhibition of translation of respective one or more GAM80 target proteins.

[12721] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM80 gene, herein designated GAM GENE, on one or more GAM80 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12722] It is appreciated that specific functions and accordingly utilities of GAM80 correlate with, and may be deduced from, the identity of the target genes which GAM80 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12723]

[12724]

[12725] LOC132241 (Accession XM_059583.7) is a GAM80 target gene, herein designated TARGET GENE. LOC132241 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC132241, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC132241 BINDING SITE, designated SEQ ID:15123, to the nucleotide sequence of GAM80 RNA, herein designated GAM RNA, also designated SEQ ID:362.

[12726] A function of GAM80 is therefore inhibition of LOC132241 (Accession XM_059583.7) . Accordingly, utilities of GAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132241.

[12727] Spleen tyrosine kinase (SYK, Accession NM_003177.2) is another GAM80 target gene, herein designated TARGET GENE. SYK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SYK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SYK BINDING SITE, designated SEQ ID:7456, to the nucleotide sequence of GAM80 RNA, herein designated GAM RNA, also designated SEQ ID:362.

[12728] Another function of GAM80 is therefore inhibition of Spleen tyrosine kinase (SYK, Accession NM_003177.2), a gene which may participate in signaling pathways and play a role in lymphocyte activation. Accordingly, utilities of GAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYK.

[12729] The function of SYK has been established by previous studies. The pig protein- tyrosine kinase SYK, with a relative molecular mass of 72,000, was first described as a protein predominantly expressed in the spleen and thymus (Zioncheck et al., 1988). The nucleotide and deduced amino acid sequence indicated that SYK is a member of the family of nonreceptor type kinases (Taniguchi et al.,

1991). Muller et al. (1994) cloned the human homolog. They found an open reading frame of 1,890 bp encoding a protein of 630 amino acids, in comparison with the pig SYK of 628 amino acids. In the human protein, the N- terminal SH2 domain spans amino acids 10- 102, the C- terminal SH2 domain spans amino acids 163- 254, and the kinase domain includes amino acids 366- 621. On the amino acid level, the overall similarity between human and pig SYK is 93%. The similarity was highest in the kinase domain.

[12730] Animal model experiments lend further support to the function of SYK. Colucci et al. (2002) noted that humans with mutations in ZAP70 have T- cell immunodeficiency, that mice lacking Zap70 have blocked T- cell development, and that mice lacking Syk have a failure of B- cell development. NK cells express both molecules, which associate with immunoreceptor tyrosine- based activation motifs (ITAMs). Using mice deficient in both Zap70 and Syk, Colucci et al. (2002) observed NK cell activity comparable to that in wildtype mice. The mutant cells expressed Nkg2d (OMIM Ref. No. 602893) and were able to lyse targets with and without Nkg2d ligands in vitro and in vivo. However, wildtype cells, but not the double- deficient

cells, responded to CD16 (OMIM Ref. No. 146740) and Ly49d (see OMIM Ref. No. 604274) cross- linking with increased cytotoxicity, suggesting that these 2 ITAM- bearing receptors are unable to signal in the mutant cells. Inhibitors of PI3K (see OMIM Ref. No. 601232) or Src kinases blocked and, in combination, abrogated cytotoxic activity in the mutant cells, whereas inhibition of both kinases was required to reduce wildtype NK activity. Colucci et al. (2002) concluded that intracellular signaling in the adaptive immune system, i.e., in B and T cells, is fundamentally different from that in the NK cells of the innate immune system.

[12731] It is appreciated that the abovementioned animal model for SYK is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[12732] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

and

[12734] Muller, B.; Cooper, L.; Terhorst, C. : Molecular cloning of the human homologue to the pig protein- tyrosine kinase syk. Immunogenetics 39: 359- 362, 1994.

[12735] Further studies establishing the function and utilities of SYK are found in John Hopkins OMIM database record ID 600085, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[12736] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 81 (GAM81), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12737] GAM81 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM81 was detected is described hereinabove with reference to Figs. 8-15.

[12738] GAM81 gene, herein designated GAM GENE, and GAM81 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[12739] GAM81 gene encodes a GAM81 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA

genes, and unlike most ordinary genes, GAM81 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM81 precursor RNA is designated SEQ ID:192, and is provided hereinbelow with reference to the sequence listing part.

[12740] GAM81 precursor RNA folds onto itself, forming GAM81 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12741] GAM81 precursor RNA folds onto itself, forming GAM81 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nu-

cleotide sequence of the second half thereof.

[12742] Nucleotide sequence of GAM81 precursor RNA, designated SEQ-ID: 192, and a schematic representation of a predicted secondary folding of GAM81 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[12743] An enzyme complex designated DICER COMPLEX, `dices` the GAM81 folded precursor RNA into GAM81 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM81 RNA is designated SEQ ID:256, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[12744] GAM81 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM81 target RNA, herein designated GAM TARGET RNA. GAM81 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein

coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12745] GAM81 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM81 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM81 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM81 RNA may have a different number of target binding sites in untranslated regions of a GAM81 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12746] The complementary binding of GAM81 RNA, herein designated GAM RNA, to target binding sites on GAM81 target

RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM81 target RNA into GAM81 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12747] It is appreciated that GAM81 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM81 target genes. The mRNA of each one of this plurality of GAM81 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM81 RNA, herein designated GAM RNA, and which when bound by GAM81 RNA causes inhibition of translation of respective one or more GAM81 target proteins.

[12748] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM81 gene, herein designated GAM GENE, on one or more GAM81 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the

known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12749] It is appreciated that specific functions and accordingly utilities of GAM81 correlate with, and may be deduced from, the identity of the target genes which GAM81 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12750]

[12751]

[12752] Ciliary neurotrophic factor receptor (CNTFR, Accession NM_001842.3) is a GAM81 target gene, herein designated TARGET GENE. CNTFR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CNTFR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CNTFR BIND-

ING SITE, designated SEQ ID:13128, to the nucleotide sequence of GAM81 RNA, herein designated GAM RNA, also designated SEQ ID:256.

[12753] A function of GAM81 is therefore inhibition of Ciliary neurotrophic factor receptor (CNTFR, Accession NM_001842.3), a gene which is critical for the developing nervous system. and therefore may be associated with Motor neuron deficits. Accordingly, utilities of GAM81 include diagnosis, prevention and treatment of Motor neuron deficits, and of other diseases and clinical conditions associated with CNTFR.

[12754] The function of CNTFR has been established by previous studies. Davis et al. (1991) used the 'tagged- ligand panning' procedure to clone a receptor for ciliary neurotrophic factor (OMIM Ref. No. 118945). This receptor is expressed exclusively in the nervous system and skeletal muscle. The CNTF receptor was found to have a structure unrelated to the receptors utilized by the nerve growth factor family of neurotrophic molecules, but instead is most homologous to the receptor for a cytokine, interleukin- 6 (IL6; 147620). This similarity suggested that the CNTF receptor, like the IL6 receptor, requires a second, signal- transducing component. In contrast to all known

receptors, the CNTF receptor is anchored to cell membranes by a glycosyl- phosphatidylinositol linkage. Donaldson et al. (1993) mapped the CNTFR gene to chromosome 9 by PCR on a panel of human/CHO somatic cell hybrids and regionalized the assignment to 9p13 by PCR on a panel of radiation hybrids By interspecific backcross linkage analysis, Pilz et al. (1995) mapped the Cntfr gene to mouse chromosome 4. By fluorescence in situ hybridization, Valenzuela et al. (1995) mapped the CNTFR gene to 9p13, and by interspecific backcross linkage analysis, they mapped the gene to mouse chromosome 4 in a region of known homology of synteny to 9p. Valenzuela et al. (1995) found that the human and mouse genes have an identical intron/exon structure that correlates well with the domain structure of the protein. The signal peptide and the immunoglobulin- like domain are each encoded by a single exon, the cytokine receptor- like domain is distributed among 4 exons, and the C- terminal glycosylphosphatidylinositol recognition domain is encoded by the final coding exon. The position of the introns within the cytokine receptor- like domain corresponds to that found in other members of the cytokine receptor superfamily

[12755]

[12756] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12757] Davis, S.; Aldrich, T. H.; Valenzuela, D. M.; Wong, V.; Furth, M. E.; Squinto, S. P.; Yancopoulos, G. D. : The receptor for ciliary neurotrophic factor. Science 253: 59- 63, 1991. ; and

[12758] Pilz, A.; Woodward, K.; Povey, S.; Abbott, C. : Comparative mapping of 50 human chromosome 9 loci in the laboratory mouse. Genomics 25: 139- 149, 1995.

[12759] Further studies establishing the function and utilities of CNTFR are found in John Hopkins OMIM database record ID 118946, and in cited publications listed in Table 5, which are hereby incorporated by reference.LOC221191 (Accession) is another GAM81 target gene, herein designated TARGET GENE. LOC221191 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221191, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221191 BINDING SITE, designated SEQ ID:17596, to the nucleotide se-

quence of GAM81 RNA, herein designated GAM RNA, also designated SEQ ID:256.

[12760] Another function of GAM81 is therefore inhibition of LOC221191 (Accession) . Accordingly, utilities of GAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221191.

[12761] LOC221535 (Accession) is another GAM81 target gene, herein designated TARGET GENE. LOC221535 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC221535, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC221535 BINDING SITE, designated SEQ ID:7033, to the nucleotide sequence of GAM81 RNA, herein designated GAM RNA, also designated SEQ ID:256.

[12762] Another function of GAM81 is therefore inhibition of LOC221535 (Accession) . Accordingly, utilities of GAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221535.

[12763] Solute carrier family 25 (mitochondrial carrier; oxoglutarate carrier), member 11 (SLC25A11, Accession NM_003562.2) is another GAM81 target gene, herein des-

ignated TARGET GENE. SLC25A11 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC25A11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC25A11 BINDING SITE, designated SEQ ID:13421, to the nucleotide sequence of GAM81 RNA, herein designated GAM RNA, also designated SEQ ID:256.

[12764] Another function of GAM81 is therefore inhibition of Solute carrier family 25 (mitochondrial carrier; oxoglutarate carrier), member 11 (SLC25A11, Accession NM_003562.2), a gene which catalyzes transport across the mitochondrial membrane .plays an important role in several metabolic processes, including the malate- aspartate shuttle, and others. Accordingly, utilities of GAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC25A11.

[12765] The function of SLC25A11 has been established by previous studies. The inner membranes of mitochondria contain a number of proteins to transport various metabolites across the mitochondrial membrane. The oxoglutarate/ malate carrier transports 2- oxoglutarate across the inner

membranes of mitochondria in an electroneutral exchange for malate or other dicarboxylic acids. Iacobazzi et al. (1992) determined the sequences of the human and bovine mitochondrial 2- oxoglutarate carrier genes from overlapping genomic clones generated by PCR. The coding and protein sequences of the human and bovine genes are 93% and 96.6% identical, respectively. The human gene has 8 exons and 7 introns and spans 2.5 kb. Its protein product has 314 amino acids and does not appear to have a processed presequence to target it into mitochondria By fluorescence in situ hybridization, Piccininni et al. (1998) mapped the SLC25A11 gene to 17p13.3

[12766]

[12767] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12768] Iacobazzi, V.; Palmieri, F.; Runswick, M. J.; Walker, J. E. : Sequences of the human and bovine genes for the mitochondrial 2- oxoglutarate carrier. DNA Seq. 3: 79- 88, 1992. ; and

[12769] Piccininni, S.; Iacobazzi, V.; Lauria, G.; Rocchi, M.; Palmieri, F. : Assignment of the oxoglutarate carrier gene (SLC20A4) to human chromosome 17p13.3. Cytogenet.

Cell Genet. 83: 256- 257.

[12770] Further studies establishing the function and utilities of SLC25A11 are found in John Hopkins OMIM database record ID 604165, and in cited publications listed in Table 5, which are hereby incorporated by reference.

[12771] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 82 (GAM82), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12772] GAM82 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM82 was detected is described hereinabove with reference to Figs. 8-15.

[12773] GAM82 gene, herein designated GAM GENE, and GAM82 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[12774] GAM82 gene encodes a GAM82 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM82 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of

GAM82 precursor RNA is designated SEQ ID:64, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:64 is located at position 5198759 relative to chromosome 17.

[12775] GAM82 precursor RNA folds onto itself, forming GAM82 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12776] GAM82 precursor RNA folds onto itself, forming GAM82 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[12777] Nucleotide sequence of GAM82 precursor RNA, desig-

nated SEQ-ID: 64, and a schematic representation of a predicted secondary folding of GAM82 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[12778] An enzyme complex designated DICER COMPLEX, `dices` the GAM82 folded precursor RNA into GAM82 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM82 RNA is designated SEQ ID:333, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[12779] GAM82 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM82 target RNA, herein designated GAM TARGET RNA. GAM82 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12780] GAM82 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM82 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM82 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM82 RNA may have a different number of target binding sites in untranslated regions of a GAM82 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12781] The complementary binding of GAM82 RNA, herein designated GAM RNA, to target binding sites on GAM82 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits

translation of GAM82 target RNA into GAM82 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12782] It is appreciated that GAM82 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM82 target genes. The mRNA of each one of this plurality of GAM82 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM82 RNA, herein designated GAM RNA, and which when bound by GAM82 RNA causes inhibition of translation of respective one or more GAM82 target proteins.

[12783] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM82 gene, herein designated GAM GENE, on one or more GAM82 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by

those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12784] It is appreciated that specific functions and accordingly utilities of GAM82 correlate with, and may be deduced from, the identity of the target genes which GAM82 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12785]

[12786]

[12787] A disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif, 5 (aggrecanase-2) (ADAMTS5, Accession NM_007038.1) is a GAM82 target gene, herein designated TARGET GENE. ADAMTS5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAMTS5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAMTS5 BINDING SITE, designated SEQ ID:9498, to the

nucleotide sequence of GAM82 RNA, herein designated GAM RNA, also designated SEQ ID:333.

[12788] A function of GAM82 is therefore inhibition of A disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif, 5 (aggrecanase-2) (ADAMTS5, Accession NM_007038.1), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. and therefore is associated with Arthritic diseases. Accordingly, utilities of GAM82 include diagnosis, prevention and treatment of Arthritic diseases., and of other diseases and clinical conditions associated with ADAMTS5.

[12789] The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM47.1.Casein kinase 2, alpha 1 polypeptide (CSNK2A1, Accession NM_177560.1) is another GAM82 target gene, herein designated TARGET GENE. CSNK2A1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CSNK2A1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of CSNK2A1 BINDING SITE, designated SEQ ID:8339, to the nucleotide sequence of GAM82 RNA, herein designated GAM RNA, also designated SEQ ID:333.

[12790] Another function of GAM82 is therefore inhibition of Casein kinase 2, alpha 1 polypeptide (CSNK2A1, Accession NM_177560.1), a gene which cphosphorylates acidic protein such as casein. Accordingly, utilities of GAM82 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK2A1.

[12791] The function of CSNK2A1 has been established by previous studies. Phosphorylation of the human p53 protein (OMIM Ref. No. 191170) at ser392 is responsive to ultraviolet (UV) but not gamma irradiation. Keller et al. (2001) identified and purified a mammalian UV- activated protein kinase complex that phosphorylates ser392 in vitro. This kinase complex contains CK2 and the chromatin transcriptional elongation factor FACT, a heterodimer of SPT16 (OMIM Ref. No. 605012) and SSRP1 (OMIM Ref. No. 604328). In vitro studies showed that FACT alters the specificity of CK2 in the complex such that it selectively phosphorylates p53 over other substrates, including casein. In addition, phosphorylation by the kinase complex was found to enhance p53 activity. These results provided

a potential mechanism for p53 activation by UV irradiation Doray et al. (2002) demonstrated that the Golgi- localized, gamma- ear- containing adenosine diphosphate ribosylation factor- binding proteins (GGA1, 606004 and GGA3, 606006) and the coat protein adaptor protein- 1 (AP- 1) complex (see OMIM Ref. No. AP1G2, 603534) colocalize in clathrin- coated buds of the trans- Golgi networks of mouse L cells and human HeLa cells. Binding studies revealed a direct interaction between the hinge domains of the GGAs and the gamma- ear domain of AP-1. Further, AP- 1 contained bound casein kinase- 2 that phosphorylated GGA1 and GGA3, thereby causing autoinhibition. Doray et al. (2002) demonstrated that this autoinhibition could induce the directed transfer of mannose 6- phosphate receptors (see OMIM Ref. No. 154540) from the GGAs to AP- 1. Mannose 6- phosphate receptors that were defective in binding to GGAs were poorly incorporated into adaptor protein complex containing clathrin coated vesicles. Thus, Doray et al. (2002) concluded that GGAs and the AP- 1 complex interact to package mannose 6- phosphate receptors into AP- 1- containing coated vesicles

[12792]

[12793] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[12794] Keller, D. M.; Zeng, X.; Wang, Y.; Zhang, Q. H.; Kapoor, M.; Shu, H.; Goodman, R.; Lozano, G.; Zhao, Y.; Lu, H. : A DNA damage- induced p53 serine 392 kinase complex contains CK2, hSpt16, and SSRP1. Molec. Cell 283- 292, 2001. ; and

[12795] Doray, B.; Ghosh, P.; Griffith, J.; Geuze, H. J.; Kornfeld, S. : Cooperation of GGAs and AP- 1 in packaging MPRs at the trans- Golgi network. Science 297: 1700- 1703, 2002.

[12796] Further studies establishing the function and utilities of CSNK2A1 are found in John Hopkins OMIM database record ID 115440, and in cited publications listed in Table 5, which are hereby incorporated by reference.Kelch-like 4 (drosophila) (KLHL4, Accession NM_019117.3) is another GAM82 target gene, herein designated TARGET GENE. KLHL4 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KLHL4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KLHL4 BINDING SITE,

designated SEQ ID:11049, to the nucleotide sequence of GAM82 RNA, herein designated GAM RNA, also designated SEQ ID:333.

[12797] Another function of GAM82 is therefore inhibition of Kelch-like 4 (drosophila) (KLHL4, Accession NM_019117.3) . Accordingly, utilities of GAM82 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL4.

[12798] LOC138639 (Accession) is another GAM82 target gene, herein designated TARGET GENE. LOC138639 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC138639, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC138639 BINDING SITE, designated SEQ ID:8881, to the nucleotide sequence of GAM82 RNA, herein designated GAM RNA, also designated SEQ ID:333.

[12799] Another function of GAM82 is therefore inhibition of LOC138639 (Accession) . Accordingly, utilities of GAM82 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138639.

[12800]

[12801] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 83 (GAM83), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12802] GAM83 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM83 was detected is described hereinabove with reference to Figs. 8-15.

[12803] GAM83 gene, herein designated GAM GENE, and GAM83 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[12804] GAM83 gene encodes a GAM83 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM83 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM83 precursor RNA is designated SEQ ID:172, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:172 is located at position 48222374 relative to chromosome 11.

[12805] GAM83 precursor RNA folds onto itself, forming GAM83

folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12806] GAM83 precursor RNA folds onto itself, forming GAM83 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[12807] Nucleotide sequence of GAM83 precursor RNA, designated SEQ-ID: 172, and a schematic representation of a predicted secondary folding of GAM83 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[12808] An enzyme complex designated DICER COMPLEX, `dices`

the GAM83 folded precursor RNA into GAM83 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: A) nucleotide sequence of GAM83 RNA is designated SEQ ID:287, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[12809] GAM83 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM83 target RNA, herein designated GAM TARGET RNA. GAM83 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[12810] GAM83 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM83 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM83

RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM83 RNA may have a different number of target binding sites in untranslated regions of a GAM83 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[12811] The complementary binding of GAM83 RNA, herein designated GAM RNA, to target binding sites on GAM83 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM83 target RNA into GAM83 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12812] It is appreciated that GAM83 target gene, herein designated TARGET GENE, in fact represents a plurality of

GAM83 target genes. The mRNA of each one of this plurality of GAM83 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM83 RNA, herein designated GAM RNA, and which when bound by GAM83 RNA causes inhibition of translation of respective one or more GAM83 target proteins.

[12813] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM83 gene, herein designated GAM GENE, on one or more GAM83 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12814] It is appreciated that specific functions and accordingly utilities of GAM83 correlate with, and may be deduced from, the identity of the target genes which GAM83 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12815]

[12816]

[12817] Angiotensin i converting enzyme (peptidyl-dipeptidase a) 1 (ACE, Accession NP_690044.1) is a GAM83 target gene, herein designated TARGET GENE. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ACE BINDING SITE, designated SEQ ID:2830, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12818] A function of GAM83 is therefore inhibition of Angiotensin i converting enzyme (peptidyl-dipeptidase a) 1 (ACE, Accession NP_690044.1), a gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). Accord-

ingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACE.

[12819] The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.ANP32E (Accession NP_112182.1) is another GAM83 target gene, herein designated TARGET GENE. ANP32E BINDING SITE1 and ANP32E BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ANP32E, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ANP32E BINDING SITE1 and ANP32E BINDING SITE2, designated SEQ ID:11390 and SEQ ID:16172 respectively, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12820] Another function of GAM83 is therefore inhibition of ANP32E (Accession NP_112182.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANP32E.

[12821] Adaptor-related protein complex 3, mu 2 subunit (AP3M2,

Accession NP_006794.1) is another GAM83 target gene, herein designated TARGET GENE. AP3M2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AP3M2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AP3M2 BINDING SITE, designated SEQ ID:17766, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12822] Another function of GAM83 is therefore inhibition of Adaptor-related protein complex 3, mu 2 subunit (AP3M2, Accession NP_006794.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3M2.

[12823] Rho guanine nucleotide exchange factor (gef) 12 (ARHGEF12, Accession NP_056128.1) is another GAM83 target gene, herein designated TARGET GENE. ARHGEF12 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHGEF12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

ARHGEF12 BINDING SITE, designated SEQ ID:6308, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12824] Another function of GAM83 is therefore inhibition of Rho guanine nucleotide exchange factor (gef) 12 (ARHGEF12, Accession NP_056128.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF12.

[12825] Aspartate beta-hydroxylase (ASPH, Accession NP_115856.1) is another GAM83 target gene, herein designated TARGET GENE. ASPH BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ASPH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASPH BINDING SITE, designated SEQ ID:11418, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12826] Another function of GAM83 is therefore inhibition of Aspartate beta-hydroxylase (ASPH, Accession NP_115856.1), a gene which specifically hydroxylates the beta carbon of aspartic acid or asparagine residues in certain epidermal

growth factor (EGF)- like domains of a number of proteins. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPH.

[12827] The function of ASPH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Aspartate beta-hydroxylase (ASPH, Accession NP_064549.1) is another GAM83 target gene, herein designated TARGET GENE. ASPH BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ASPH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ASPH BINDING SITE, designated SEQ ID:11418, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12828] Another function of GAM83 is therefore inhibition of Aspartate beta-hydroxylase (ASPH, Accession NP_064549.1), a gene which specifically hydroxylates the beta carbon of aspartic acid or asparagine residues in certain epidermal growth factor (EGF)- like domains of a number of pro-

teins. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPH.

[12829] The function of ASPH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Atpase, na+/k+ transporting, beta 3 polypeptide (ATP1B3, Accession NP_001670.1) is another GAM83 target gene, herein designated TARGET GENE. ATP1B3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP1B3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP1B3 BINDING SITE, designated SEQ ID:9521, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12830] Another function of GAM83 is therefore inhibition of Atpase, na+/k+ transporting, beta 3 polypeptide (ATP1B3, Accession NP_001670.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B3.

[12831] Atpase, ca++ transporting, type 2c, member 1 (ATP2C1,

Accession NP_055197.1) is another GAM83 target gene, herein designated TARGET GENE. ATP2C1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ATP2C1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ATP2C1 BINDING SITE, designated SEQ ID:9108, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12832] Another function of GAM83 is therefore inhibition of Atpase, ca++ transporting, type 2c, member 1 (ATP2C1, Accession NP_055197.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2C1.

[12833] Btb and cnc homology 1, basic leucine zipper transcription factor 2 (BACH2, Accession NP_068585.1) is another GAM83 target gene, herein designated TARGET GENE. BACH2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BACH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of BACH2 BINDING SITE, designated SEQ ID:13836, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12834] Another function of GAM83 is therefore inhibition of Btb and cnc homology 1, basic leucine zipper transcription factor 2 (BACH2, Accession NP_068585.1), a gene which acts as repressor or activator, binds to maf recognition elements and therefore may be associated with Non-hodgkin lymphoma. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Non-hodgkin lymphoma, and of other diseases and clinical conditions associated with BACH2.

[12835] The function of BACH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.BHC80 (Accession NP_057705.2) is another GAM83 target gene, herein designated TARGET GENE. BHC80 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BHC80, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BHC80 BINDING SITE, designated SEQ ID:7380, to the

nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12836] Another function of GAM83 is therefore inhibition of BHC80 (Accession NP_057705.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHC80.

[12837] C14orf24 (Accession NP_775878.1) is another GAM83 target gene, herein designated TARGET GENE. C14orf24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf24 BINDING SITE, designated SEQ ID:831, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12838] Another function of GAM83 is therefore inhibition of C14orf24 (Accession NP_775878.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf24.

[12839] C14orf39 (Accession NP_777638.1) is another GAM83 target gene, herein designated TARGET GENE. C14orf39 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by C14orf39, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf39 BINDING SITE, designated SEQ ID:10766, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12840] Another function of GAM83 is therefore inhibition of C14orf39 (Accession NP_777638.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf39.

[12841] C14orf78 (Accession XP_290629.1) is another GAM83 target gene, herein designated TARGET GENE. C14orf78 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C14orf78, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C14orf78 BINDING SITE, designated SEQ ID:11042, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12842] Another function of GAM83 is therefore inhibition of C14orf78 (Accession XP_290629.1) . Accordingly, utilities

of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf78.

[12843] Chromosome 21 open reading frame 55 (C21orf55, Accession NP_060303.1) is another GAM83 target gene, herein designated TARGET GENE. C21orf55 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by C21orf55, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C21orf55 BINDING SITE, designated SEQ ID:15819, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12844] Another function of GAM83 is therefore inhibition of Chromosome 21 open reading frame 55 (C21orf55, Accession NP_060303.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf55.

[12845] Chromosome 5 open reading frame 4 (C5orf4, Accession NP_115761.1) is another GAM83 target gene, herein designated TARGET GENE. C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by

C5orf4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2, designated SEQ ID:2131 and SEQ ID:16902 respectively, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12846] Another function of GAM83 is therefore inhibition of Chromosome 5 open reading frame 4 (C5orf4, Accession NP_115761.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4.

[12847] Chromosome 5 open reading frame 4 (C5orf4, Accession NP_057432.1) is another GAM83 target gene, herein designated TARGET GENE. C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by C5orf4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2, designated SEQ ID:16902 and SEQ ID:18232 respectively, to the nucleotide sequence of

GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12848] Another function of GAM83 is therefore inhibition of Chromosome 5 open reading frame 4 (C5orf4, Accession NP_057432.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4.

[12849] Cholecystokinin b receptor (CCKBR, Accession NP_795344.1) is another GAM83 target gene, herein designated TARGET GENE. CCKBR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCKBR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCKBR BINDING SITE, designated SEQ ID:6458, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12850] Another function of GAM83 is therefore inhibition of Cholecystokinin b receptor (CCKBR, Accession NP_795344.1), a gene which bonds cholecystokinin, regulates emotion and gastric acid secretion. Accordingly, utilities of GAM83 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with CCKBR.

[12851] The function of CCKBR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Cholecystokinin b receptor (CCKBR, Accession NP_000722.2) is another GAM83 target gene, herein designated TARGET GENE. CCKBR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CCKBR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CCKBR BINDING SITE, designated SEQ ID:6458, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12852] Another function of GAM83 is therefore inhibition of Cholecystokinin b receptor (CCKBR, Accession NP_000722.2), a gene which bonds cholecystokinin, regulates emotion and gastric acid secretion. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCKBR.

[12853] The function of CCKBR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Collagen-like tail subunit (single strand of homotrimer) of asymmetric acetylcholinesterase (COLQ, Accession NP_536803.1) is another GAM83 target gene, herein designated TARGET GENE. COLQ BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COLQ, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COLQ BINDING SITE, designated SEQ ID:9718, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12854] Another function of GAM83 is therefore inhibition of Collagen-like tail subunit (single strand of homotrimer) of asymmetric acetylcholinesterase (COLQ, Accession NP_536803.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLQ.

[12855] Collagen-like tail subunit (single strand of homotrimer) of asymmetric acetylcholinesterase (COLQ, Accession

NP_536804.1) is another GAM83 target gene, herein designated TARGET GENE. COLQ BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by COLQ, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of COLQ BINDING SITE, designated SEQ ID:9718, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12856] Another function of GAM83 is therefore inhibition of Collagen-like tail subunit (single strand of homotrimer) of asymmetric acetylcholinesterase (COLQ, Accession NP_536804.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLQ.

[12857] Complement component (3b/4b) receptor 1, including knops blood group system (CR1, Accession NP_000564.1) is another GAM83 target gene, herein designated TARGET GENE. CR1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CR1 BINDING SITE, designated SEQ ID:10491, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12858] Another function of GAM83 is therefore inhibition of Complement component (3b/4b) receptor 1, including knops blood group system (CR1, Accession NP_000564.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CR1.

[12859] Chemokine (c-x3-c motif) receptor 1 (CX3CR1, Accession NP_001328.1) is another GAM83 target gene, herein designated TARGET GENE. CX3CR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CX3CR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CX3CR1 BINDING SITE, designated SEQ ID:10405, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12860] Another function of GAM83 is therefore inhibition of

Chemokine (c-x3-c motif) receptor 1 (CX3CR1, Accession NP_001328.1), a gene which mediates both the adhesive and migratory functions of fractalkine and therefore may be associated with Human immunodeficiency virus type 1. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Human immunodeficiency virus type 1., and of other diseases and clinical conditions associated with CX3CR1.

[12861] The function of CX3CR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Cylindromatosis (turban tumor syndrome) (CYLD, Accession NP_056062.1) is another GAM83 target gene, herein designated TARGET GENE. CYLD BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CYLD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CYLD BINDING SITE, designated SEQ ID:11043, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12862] Another function of GAM83 is therefore inhibition of

Cylindromatosis (turban tumor syndrome) (CYLD, Accession NP_056062.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYLD.

[12863] 24-dehydrocholesterol reductase (DHCR24, Accession NP_055577.1) is another GAM83 target gene, herein designated TARGET GENE. DHCR24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DHCR24 BINDING SITE, designated SEQ ID:14070, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12864] Another function of GAM83 is therefore inhibition of 24-dehydrocholesterol reductase (DHCR24, Accession NP_055577.1), a gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Desmosterolosis. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Desmosterolosis., and of other diseases and clinical conditions associated with DHCR24.

[12865] The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.DIRAS2 (Accession NP_060064.2) is another GAM83 target gene, herein designated TARGET GENE. DIRAS2 BINDING SITE1 and DIRAS2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DIRAS2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DIRAS2 BINDING SITE1 and DIRAS2 BINDING SITE2, designated SEQ ID:16186 and SEQ ID:14097 respectively, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12866] Another function of GAM83 is therefore inhibition of DIRAS2 (Accession NP_060064.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIRAS2.

[12867] DKFZp547I094 (Accession NP_115531.1) is another GAM83 target gene, herein designated TARGET GENE. DKFZp547I094 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by DK-

FZp547I094, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp547I094 BINDING SITE, designated SEQ ID:2790, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12868] Another function of GAM83 is therefore inhibition of DKFZp547I094 (Accession NP_115531.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I094.

[12869] DKFZP564O0423 (Accession XP_166254.2) is another GAM83 target gene, herein designated TARGET GENE. DKFZP564O0423 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP564O0423, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP564O0423 BINDING SITE, designated SEQ ID:1156, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12870] Another function of GAM83 is therefore inhibition of DKFZP564O0423 (Accession XP_166254.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0423.

[12871] DKFZP586F2423 (Accession XP_291242.1) is another GAM83 target gene, herein designated TARGET GENE. DKFZP586F2423 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP586F2423, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP586F2423 BINDING SITE, designated SEQ ID:12701, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12872] Another function of GAM83 is therefore inhibition of DKFZP586F2423 (Accession XP_291242.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586F2423.

[12873] DKFZp761B107 (Accession NP_775734.1) is another GAM83 target gene, herein designated TARGET GENE. DK-

FZp761B107 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DK-FZp761B107, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZp761B107 BINDING SITE, designated SEQ ID:19365, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12874] Another function of GAM83 is therefore inhibition of DK-FZp761B107 (Accession NP_775734.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B107.

[12875] E2f transcription factor 3 (E2F3, Accession NP_001940.1) is another GAM83 target gene, herein designated TARGET GENE. E2F3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by E2F3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of E2F3 BINDING SITE, designated SEQ ID:13295, to the nucleotide sequence of GAM83 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:287.

[12876] Another function of GAM83 is therefore inhibition of E2f transcription factor 3 (E2F3, Accession NP_001940.1), a gene which binds dna and controls cell- cycle progression from g1 to s phase. and therefore may be associated with Hereditary autosomal dominant myoclonus dystonia. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Hereditary autosomal dominant myoclonus dystonia, and of other diseases and clinical conditions associated with E2F3.

[12877] The function of E2F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Endothelial differentiation, lysophosphatidic acid g-protein-coupled receptor, 2 (EDG2, Accession NP_476500.1) is another GAM83 target gene, herein designated TARGET GENE. EDG2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EDG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EDG2 BINDING SITE, designated SEQ ID:10299, to the nucleotide

sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12878] Another function of GAM83 is therefore inhibition of Endothelial differentiation, lysophosphatidic acid g-protein-coupled receptor, 2 (EDG2, Accession NP_476500.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDG2.

[12879] Endothelial differentiation, lysophosphatidic acid g-protein-coupled receptor, 2 (EDG2, Accession NP_001392.2) is another GAM83 target gene, herein designated TARGET GENE. EDG2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by EDG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of EDG2 BINDING SITE, designated SEQ ID:10299, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12880] Another function of GAM83 is therefore inhibition of Endothelial differentiation, lysophosphatidic acid g-protein-coupled receptor, 2 (EDG2, Accession

NP_001392.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDG2.

[12881] Fk506 binding protein 2, 13kda (FKBP2, Accession NP_004461.2) is another GAM83 target gene, herein designated TARGET GENE. FKBP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FKBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FKBP2 BINDING SITE, designated SEQ ID:11911, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12882] Another function of GAM83 is therefore inhibition of Fk506 binding protein 2, 13kda (FKBP2, Accession NP_004461.2), a gene which ppiases accelerate the folding of proteins. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP2.

[12883] The function of FKBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to GAM44.1.Fk506 binding protein 2, 13kda (FKBP2, Accession NP_476433.1) is another GAM83 target gene, herein designated TARGET GENE. FKBP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by FKBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FKBP2 BINDING SITE, designated SEQ ID:11911, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12884] Another function of GAM83 is therefore inhibition of Fk506 binding protein 2, 13kda (FKBP2, Accession NP_476433.1), a gene which ppiases accelerate the folding of proteins. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP2.

[12885] The function of FKBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.FLJ10945 (Accession NP_060750.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ10945 BINDING SITE is a target binding site found in

the 3` untranslated region of mRNA encoded by FLJ10945, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ10945 BINDING SITE, designated SEQ ID:3221, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12886] Another function of GAM83 is therefore inhibition of FLJ10945 (Accession NP_060750.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10945.

[12887] FLJ11730 (Accession NP_073593.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ11730 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11730, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11730 BINDING SITE, designated SEQ ID:13471, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12888] Another function of GAM83 is therefore inhibition of FLJ11730 (Accession NP_073593.1) . Accordingly, utilities

of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11730.

[12889] FLJ11871 (Accession NP_079393.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ11871 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11871, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11871 BINDING SITE, designated SEQ ID:18221, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12890] Another function of GAM83 is therefore inhibition of FLJ11871 (Accession NP_079393.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11871.

[12891] FLJ12425 (Accession XP_098290.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ12425 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12425, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ12425 BINDING SITE, designated SEQ ID:7079, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12892] Another function of GAM83 is therefore inhibition of FLJ12425 (Accession XP_098290.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12425.

[12893] FLJ12529 (Accession NP_079087.2) is another GAM83 target gene, herein designated TARGET GENE. FLJ12529 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ12529, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ12529 BINDING SITE, designated SEQ ID:17806, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12894] Another function of GAM83 is therefore inhibition of FLJ12529 (Accession NP_079087.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12529.

[12895] FLJ13089 (Accession NP_079229.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ13089

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13089, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13089 BINDING SITE, designated SEQ ID:10552, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12896] Another function of GAM83 is therefore inhibition of FLJ13089 (Accession NP_079229.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13089.

[12897] FLJ13848 (Accession NP_079047.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ13848 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ13848, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13848 BINDING SITE, designated SEQ ID:19252, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12898] Another function of GAM83 is therefore inhibition of

FLJ13848 (Accession NP_079047.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13848.

[12899] FLJ14721 (Accession NP_116218.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ14721 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ14721, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ14721 BINDING SITE, designated SEQ ID:14879, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12900] Another function of GAM83 is therefore inhibition of FLJ14721 (Accession NP_116218.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14721.

[12901] FLJ20856 (Accession NP_079419.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ20856 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ20856, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of FLJ20856 BINDING SITE, designated SEQ ID:3537, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12902] Another function of GAM83 is therefore inhibition of FLJ20856 (Accession NP_079419.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20856.

[12903] FLJ21156 (Accession NP_078878.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ21156 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21156, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21156 BINDING SITE, designated SEQ ID:485, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12904] Another function of GAM83 is therefore inhibition of FLJ21156 (Accession NP_078878.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21156.

[12905] FLJ23518 (Accession NP_079001.2) is another GAM83 tar-

get gene, herein designated TARGET GENE. FLJ23518 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ23518, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ23518 BINDING SITE, designated SEQ ID:11473, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12906] Another function of GAM83 is therefore inhibition of FLJ23518 (Accession NP_079001.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23518.

[12907] FLJ25534 (Accession NP_694966.2) is another GAM83 target gene, herein designated TARGET GENE. FLJ25534 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ25534, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ25534 BINDING SITE, designated SEQ ID:1034, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12908] Another function of GAM83 is therefore inhibition of FLJ25534 (Accession NP_694966.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25534.

[12909] FLJ30532 (Accession NP_653325.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ30532 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30532, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30532 BINDING SITE, designated SEQ ID:1559, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12910] Another function of GAM83 is therefore inhibition of FLJ30532 (Accession NP_653325.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30532.

[12911] FLJ32069 (Accession NP_694578.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ32069 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32069, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32069 BINDING SITE, designated SEQ ID:19969, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12912] Another function of GAM83 is therefore inhibition of FLJ32069 (Accession NP_694578.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32069.

[12913] FLJ32312 (Accession NP_653310.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ32312 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ32312, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ32312 BINDING SITE, designated SEQ ID:6992, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12914] Another function of GAM83 is therefore inhibition of FLJ32312 (Accession NP_653310.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32312.

[12915] FLJ34047 (Accession NP_775940.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ34047 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ34047, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ34047 BINDING SITE, designated SEQ ID:5426, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12916] Another function of GAM83 is therefore inhibition of FLJ34047 (Accession NP_775940.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ34047.

[12917] FLJ39639 (Accession XP_290687.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ39639 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ39639, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ39639 BINDING SITE, designated SEQ ID:7460, to the nucleotide sequence of GAM83 RNA, herein designated

GAM RNA, also designated SEQ ID:287.

[12918] Another function of GAM83 is therefore inhibition of FLJ39639 (Accession XP_290687.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ39639.

[12919] FLJ40288 (Accession NP_775953.1) is another GAM83 target gene, herein designated TARGET GENE. FLJ40288 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ40288, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ40288 BINDING SITE, designated SEQ ID:15256, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12920] Another function of GAM83 is therefore inhibition of FLJ40288 (Accession NP_775953.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ40288.

[12921] Formin binding protein 4 (FNBP4, Accession NP_056123.1) is another GAM83 target gene, herein designated TARGET GENE. FNBP4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FNBP4,

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FNBP4 BINDING SITE, designated SEQ ID:13556, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12922] Another function of GAM83 is therefore inhibition of Formin binding protein 4 (FNBP4, Accession NP_056123.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FNBP4.

[12923] GAS8 (Accession NP_001472.1) is another GAM83 target gene, herein designated TARGET GENE. GAS8 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GAS8, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GAS8 BINDING SITE, designated SEQ ID:6978, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12924] Another function of GAM83 is therefore inhibition of GAS8 (Accession NP_001472.1) . Accordingly, utilities of GAM83

include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAS8.

[12925] Gata binding protein 2 (GATA2, Accession NP_116027.2) is another GAM83 target gene, herein designated TARGET GENE. GATA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GATA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GATA2 BINDING SITE, designated SEQ ID:2059, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12926] Another function of GAM83 is therefore inhibition of Gata binding protein 2 (GATA2, Accession NP_116027.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA2.

[12927] Glycosylphosphatidylinositol specific phospholipase d1 (GPLD1, Accession NP_001494.2) is another GAM83 target gene, herein designated TARGET GENE. GPLD1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by GPLD1, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPLD1 BINDING SITE, designated SEQ ID:17577, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12928] Another function of GAM83 is therefore inhibition of Glycosylphosphatidylinositol specific phospholipase d1 (GPLD1, Accession NP_001494.2), a gene which hydrolyses the inositol phosphate linkage in proteins anchored by phosphatidylinositol glycans to release these proteins from the membrane. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPLD1.

[12929] The function of GPLD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.G protein-coupled receptor 68 (GPR68, Accession NP_003476.1) is another GAM83 target gene, herein designated TARGET GENE. GPR68 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GPR68, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementar-

ity of the nucleotide sequences of GPR68 BINDING SITE, designated SEQ ID:4765, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12930] Another function of GAM83 is therefore inhibition of G protein-coupled receptor 68 (GPR68, Accession NP_003476.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR68.

[12931] G protein-coupled receptor 77 (GPR77, Accession NP_060955.1) is another GAM83 target gene, herein designated TARGET GENE. GPR77 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GPR77, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GPR77 BINDING SITE, designated SEQ ID:2326, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12932] Another function of GAM83 is therefore inhibition of G protein-coupled receptor 77 (GPR77, Accession NP_060955.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with GPR77.

[12933] GW112 (Accession NP_006409.2) is another GAM83 target gene, herein designated TARGET GENE. GW112 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GW112, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GW112 BINDING SITE, designated SEQ ID:17202, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12934] Another function of GAM83 is therefore inhibition of GW112 (Accession NP_006409.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GW112.

[12935] Hepatitis a virus cellular receptor 1 (HAVCR1, Accession NP_036338.1) is another GAM83 target gene, herein designated TARGET GENE. HAVCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HAVCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HAVCR1 BINDING SITE, desig-

nated SEQ ID:1838, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12936] Another function of GAM83 is therefore inhibition of Hepatitis a virus cellular receptor 1 (HAVCR1, Accession NP_036338.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAVCR1.

[12937] Homeo box b7 (HOXB7, Accession NP_004493.2) is another GAM83 target gene, herein designated TARGET GENE. HOXB7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HOXB7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HOXB7 BINDING SITE, designated SEQ ID:14802, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12938] Another function of GAM83 is therefore inhibition of Homeo box b7 (HOXB7, Accession NP_004493.2), a gene which is a member of homeodomain family of DNA binding proteins; may regulate gene expression, morphogenesis, and differentiation. Accordingly, utilities of GAM83 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB7.

[12939] The function of HOXB7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Hermansky-pudlak syndrome 3 (HPS3, Accession NP_115759.2) is another GAM83 target gene, herein designated TARGET GENE. HPS3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HPS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HPS3 BINDING SITE, designated SEQ ID:10776, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12940] Another function of GAM83 is therefore inhibition of Hermansky-pudlak syndrome 3 (HPS3, Accession NP_115759.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS3.

[12941] HSPC133 (Accession NP_054887.1) is another GAM83 target gene, herein designated TARGET GENE. HSPC133

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HSPC133, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HSPC133 BINDING SITE, designated SEQ ID:19037, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12942] Another function of GAM83 is therefore inhibition of HSPC133 (Accession NP_054887.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC133.

[12943] HT001 (Accession NP_054784.1) is another GAM83 target gene, herein designated TARGET GENE. HT001 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HT001, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HT001 BINDING SITE, designated SEQ ID:2559, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12944] Another function of GAM83 is therefore inhibition of

HT001 (Accession NP_054784.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT001.

[12945] ICK (Accession NP_057597.2) is another GAM83 target gene, herein designated TARGET GENE. ICK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ICK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:4546, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12946] Another function of GAM83 is therefore inhibition of ICK (Accession NP_057597.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK.

[12947] ICK (Accession NP_055735.1) is another GAM83 target gene, herein designated TARGET GENE. ICK BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ICK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:4546, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12948] Another function of GAM83 is therefore inhibition of ICK (Accession NP_055735.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK.

[12949] Insulin-like growth factor 2 receptor (IGF2R, Accession NP_000867.1) is another GAM83 target gene, herein designated TARGET GENE. IGF2R BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF2R, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IGF2R BINDING SITE, designated SEQ ID:11950, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12950] Another function of GAM83 is therefore inhibition of Insulin-like growth factor 2 receptor (IGF2R, Accession NP_000867.1), a gene which transport of phosphorylated lysosomal enzymes from the golgi complex and the cell surface to lysosomes. lysosomal enzymes bearing phos-

phomannosyl residues bind specifically to mannose- 6-phosphate receptors in the golgi apparatus and the resulting receptor- ligand complex is transported to an acidic prelyosomal compartment where the low ph mediates the dissociation of the complex. this receptor also binds insulin growth factor ii. and therefore may be associated with Hepatocellular carcinoma, somatic. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Hepatocellular carcinoma, somatic, and of other diseases and clinical conditions associated with IGF2R.

[12951] The function of IGF2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Interleukin 28 receptor, alpha (IL28RA, Accession NP_775088.1) is another GAM83 target gene, herein designated TARGET GENE. IL28RA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by IL28RA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IL28RA BINDING SITE, designated SEQ ID:3043, to the nu-

cleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12952] Another function of GAM83 is therefore inhibition of Interleukin 28 receptor, alpha (IL28RA, Accession NP_775088.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL28RA.

[12953] IMMP2L (Accession NP_115938.1) is another GAM83 target gene, herein designated TARGET GENE. IMMP2L BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IMMP2L, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of IMMP2L BINDING SITE, designated SEQ ID:2346, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12954] Another function of GAM83 is therefore inhibition of IMMP2L (Accession NP_115938.1), a gene which is a HOMOLOG of YEAST INNER MITOCHONDRIAL MEMBRANE PEPTIDASE. and therefore may be associated with Tourette syndrome. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Tourette syndrome,

and of other diseases and clinical conditions associated with IMMP2L.

[12955] The function of IMMP2L and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Inositol polyphosphate-5-phosphatase, 72kda (INPP5E, Accession NP_063945.1) is another GAM83 target gene, herein designated TARGET GENE. INPP5E BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by INPP5E, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of INPP5E BINDING SITE, designated SEQ ID:17360, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12956] Another function of GAM83 is therefore inhibition of Inositol polyphosphate-5-phosphatase, 72kda (INPP5E, Accession NP_063945.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5E.

[12957] Il2-inducible t-cell kinase (ITK, Accession NP_005537.3) is another GAM83 target gene, herein designated TARGET

GENE. ITK BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ITK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ITK BINDING SITE, designated SEQ ID:1134, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12958] Another function of GAM83 is therefore inhibition of Il2-inducible t-cell kinase (ITK, Accession NP_005537.3), a gene which plays a role in t cell proliferation and differentiation. and therefore may be associated with Myelodysplastic syndrome. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Myelodysplastic syndrome, and of other diseases and clinical conditions associated with ITK.

[12959] The function of ITK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.KIAA0391 (Accession NP_055487.1) is another GAM83 target gene, herein designated TARGET GENE. KIAA0391 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by

KIAA0391, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:728, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12960] Another function of GAM83 is therefore inhibition of KIAA0391 (Accession NP_055487.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0391.

[12961] KIAA0523 (Accession XP_041964.5) is another GAM83 target gene, herein designated TARGET GENE. KIAA0523 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0523, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0523 BINDING SITE, designated SEQ ID:2007, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12962] Another function of GAM83 is therefore inhibition of KIAA0523 (Accession XP_041964.5) . Accordingly, utilities

of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0523.

[12963] KIAA0789 (Accession XP_033113.1) is another GAM83 target gene, herein designated TARGET GENE. KIAA0789 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0789, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0789 BINDING SITE, designated SEQ ID:1640, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12964] Another function of GAM83 is therefore inhibition of KIAA0789 (Accession XP_033113.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0789.

[12965] KIAA0984 (Accession XP_037557.2) is another GAM83 target gene, herein designated TARGET GENE. KIAA0984 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0984, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0984 BINDING SITE, designated SEQ ID:12474, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12966] Another function of GAM83 is therefore inhibition of KIAA0984 (Accession XP_037557.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0984.

[12967] KIAA1332 (Accession XP_048774.2) is another GAM83 target gene, herein designated TARGET GENE. KIAA1332 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1332, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1332 BINDING SITE, designated SEQ ID:12318, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12968] Another function of GAM83 is therefore inhibition of KIAA1332 (Accession XP_048774.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KIAA1332.

[12969] KIAA1684 (Accession XP_290806.1) is another GAM83 target gene, herein designated TARGET GENE. KIAA1684 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1684, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1684 BINDING SITE, designated SEQ ID:12907, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12970] Another function of GAM83 is therefore inhibition of KIAA1684 (Accession XP_290806.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1684.

[12971] KIAA1720 (Accession NP_085148.1) is another GAM83 target gene, herein designated TARGET GENE. KIAA1720 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1720, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of KIAA1720 BINDING SITE, designated SEQ ID:15787, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12972] Another function of GAM83 is therefore inhibition of KIAA1720 (Accession NP_085148.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1720.

[12973] KIAA1920 (Accession XP_085210.1) is another GAM83 target gene, herein designated TARGET GENE. KIAA1920 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by KIAA1920, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1920 BINDING SITE, designated SEQ ID:8388, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12974] Another function of GAM83 is therefore inhibition of KIAA1920 (Accession XP_085210.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1920.

[12975] KIAA1946 (Accession NP_803237.1) is another GAM83 target gene, herein designated TARGET GENE. KIAA1946 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1946, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1946 BINDING SITE, designated SEQ ID:8568, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12976] Another function of GAM83 is therefore inhibition of KIAA1946 (Accession NP_803237.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1946.

[12977] Karyopherin alpha 6 (importin alpha 7) (KPNA6, Accession NP_036448.1) is another GAM83 target gene, herein designated TARGET GENE. KPNA6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KPNA6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of KPNA6 BINDING SITE, designated SEQ ID:16094, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12978] Another function of GAM83 is therefore inhibition of Karyopherin alpha 6 (importin alpha 7) (KPNA6, Accession NP_036448.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNA6.

[12979] Like-glycosyltransferase (LARGE, Accession NP_004728.1) is another GAM83 target gene, herein designated TARGET GENE. LARGE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LARGE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LARGE BINDING SITE, designated SEQ ID:14179, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12980] Another function of GAM83 is therefore inhibition of Like-glycosyltransferase (LARGE, Accession NP_004728.1), a gene which is a member of the N- acetylglucosaminyltransferase family. Accordingly, utilities of GAM83 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with LARGE.

[12981] The function of LARGE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Like-glycosyltransferase (LARGE, Accession NP_598397.1) is another GAM83 target gene, herein designated TARGET GENE. LARGE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LARGE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LARGE BINDING SITE, designated SEQ ID:14179, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12982] Another function of GAM83 is therefore inhibition of Like-glycosyltransferase (LARGE, Accession NP_598397.1), a gene which is a member of the N- acetylglucosaminyl-transferase family. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LARGE.

[12983] The function of LARGE and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.LAX (Accession NP_060243.1) is another GAM83 target gene, herein designated TARGET GENE. LAX BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LAX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LAX BINDING SITE, designated SEQ ID:9263, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12984] Another function of GAM83 is therefore inhibition of LAX (Accession NP_060243.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAX.

[12985] Leucine zipper, down-regulated in cancer 1 (LDOC1, Accession NP_036449.1) is another GAM83 target gene, herein designated TARGET GENE. LDOC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LDOC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the comple-

mentarity of the nucleotide sequences of LDOC1 BINDING SITE, designated SEQ ID:2933, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12986] Another function of GAM83 is therefore inhibition of Leucine zipper, down-regulated in cancer 1 (LDOC1, Accession NP_036449.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDOC1.

[12987] Lipoma hmgic fusion partner (LHFP, Accession NP_005771.1) is another GAM83 target gene, herein designated TARGET GENE. LHFP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LHFP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LHFP BINDING SITE, designated SEQ ID:12839, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12988] Another function of GAM83 is therefore inhibition of Lipoma hmgic fusion partner (LHFP, Accession NP_005771.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with LHFP.

[12989] Lin-7 homolog a (c. elegans) (LIN7A, Accession NP_004655.1) is another GAM83 target gene, herein designated TARGET GENE. LIN7A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LIN7A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LIN7A BINDING SITE, designated SEQ ID:3012, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12990] Another function of GAM83 is therefore inhibition of Lin-7 homolog a (c. elegans) (LIN7A, Accession NP_004655.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIN7A.

[12991] LOC118987 (Accession NP_776152.1) is another GAM83 target gene, herein designated TARGET GENE. LOC118987 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC118987, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC118987 BINDING SITE, designated SEQ ID:9092, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12992] Another function of GAM83 is therefore inhibition of LOC118987 (Accession NP_776152.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118987.

[12993] LOC126017 (Accession XP_064903.7) is another GAM83 target gene, herein designated TARGET GENE. LOC126017 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126017, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126017 BINDING SITE, designated SEQ ID:19476, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12994] Another function of GAM83 is therefore inhibition of LOC126017 (Accession XP_064903.7) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126017.

[12995] LOC126731 (Accession NP_660300.1) is another GAM83 target gene, herein designated TARGET GENE. LOC126731 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC126731, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC126731 BINDING SITE, designated SEQ ID:18542, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12996] Another function of GAM83 is therefore inhibition of LOC126731 (Accession NP_660300.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126731.

[12997] LOC130752 (Accession XP_059468.3) is another GAM83 target gene, herein designated TARGET GENE. LOC130752 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC130752, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC130752 BINDING SITE, designated SEQ ID:10734, to

the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[12998] Another function of GAM83 is therefore inhibition of LOC130752 (Accession XP_059468.3) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130752.

[12999] LOC144486 (Accession XP_096608.1) is another GAM83 target gene, herein designated TARGET GENE. LOC144486 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC144486, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC144486 BINDING SITE, designated SEQ ID:16849, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13000] Another function of GAM83 is therefore inhibition of LOC144486 (Accession XP_096608.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144486.

[13001] LOC145053 (Accession XP_096714.1) is another GAM83

target gene, herein designated TARGET GENE. LOC145053 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145053, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145053 BINDING SITE, designated SEQ ID:16596, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13002] Another function of GAM83 is therefore inhibition of LOC145053 (Accession XP_096714.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145053.

[13003] LOC145216 (Accession XP_096730.1) is another GAM83 target gene, herein designated TARGET GENE. LOC145216 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC145216, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC145216 BINDING SITE, designated SEQ ID:18659, to the nucleotide sequence of GAM83 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:287.

[13004] Another function of GAM83 is therefore inhibition of LOC145216 (Accession XP_096730.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145216.

[13005] LOC146227 (Accession XP_085374.2) is another GAM83 target gene, herein designated TARGET GENE. LOC146227 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146227, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146227 BINDING SITE, designated SEQ ID:1810, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13006] Another function of GAM83 is therefore inhibition of LOC146227 (Accession XP_085374.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146227.

[13007] LOC146443 (Accession XP_085461.6) is another GAM83 target gene, herein designated TARGET GENE. LOC146443

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146443, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146443 BINDING SITE, designated SEQ ID:15013, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13008] Another function of GAM83 is therefore inhibition of LOC146443 (Accession XP_085461.6) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146443.

[13009] LOC146728 (Accession XP_097074.1) is another GAM83 target gene, herein designated TARGET GENE. LOC146728 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC146728, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146728 BINDING SITE, designated SEQ ID:16534, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13010] Another function of GAM83 is therefore inhibition of LOC146728 (Accession XP_097074.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146728.

[13011] LOC146856 (Accession XP_096086.1) is another GAM83 target gene, herein designated TARGET GENE. LOC146856 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC146856, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC146856 BINDING SITE, designated SEQ ID:17740, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13012] Another function of GAM83 is therefore inhibition of LOC146856 (Accession XP_096086.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146856.

[13013] LOC147947 (Accession XP_085974.1) is another GAM83 target gene, herein designated TARGET GENE. LOC147947 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC147947, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC147947 BINDING SITE, designated SEQ ID:6702, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13014] Another function of GAM83 is therefore inhibition of LOC147947 (Accession XP_085974.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147947.

[13015] LOC148490 (Accession XP_086210.2) is another GAM83 target gene, herein designated TARGET GENE. LOC148490 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148490, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148490 BINDING SITE, designated SEQ ID:18524, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13016] Another function of GAM83 is therefore inhibition of

LOC148490 (Accession XP_086210.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148490.

[13017] LOC149420 (Accession NP_690048.1) is another GAM83 target gene, herein designated TARGET GENE. LOC149420 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149420, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149420 BINDING SITE, designated SEQ ID:19107, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13018] Another function of GAM83 is therefore inhibition of LOC149420 (Accession NP_690048.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149420.

[13019] LOC151242 (Accession XP_087137.2) is another GAM83 target gene, herein designated TARGET GENE. LOC151242 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC151242, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151242 BINDING SITE, designated SEQ ID:1944, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13020] Another function of GAM83 is therefore inhibition of LOC151242 (Accession XP_087137.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151242.

[13021] LOC151610 (Accession XP_087245.1) is another GAM83 target gene, herein designated TARGET GENE. LOC151610 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151610, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151610 BINDING SITE, designated SEQ ID:12037, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13022] Another function of GAM83 is therefore inhibition of LOC151610 (Accession XP_087245.1) . Accordingly, utili-

ties of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151610.

[13023] LOC152519 (Accession XP_087483.3) is another GAM83 target gene, herein designated TARGET GENE. LOC152519 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC152519, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC152519 BINDING SITE, designated SEQ ID:12979, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13024] Another function of GAM83 is therefore inhibition of LOC152519 (Accession XP_087483.3) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152519.

[13025] LOC153077 (Accession XP_098307.1) is another GAM83 target gene, herein designated TARGET GENE. LOC153077 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC153077, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153077 BINDING SITE, designated SEQ ID:16808, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13026] Another function of GAM83 is therefore inhibition of LOC153077 (Accession XP_098307.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153077.

[13027] LOC157531 (Accession XP_098772.1) is another GAM83 target gene, herein designated TARGET GENE. LOC157531 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by LOC157531, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157531 BINDING SITE, designated SEQ ID:3461, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13028] Another function of GAM83 is therefore inhibition of LOC157531 (Accession XP_098772.1) . Accordingly, utili-

ties of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157531.

[13029] LOC158125 (Accession XP_088492.2) is another GAM83 target gene, herein designated TARGET GENE. LOC158125 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC158125, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC158125 BINDING SITE, designated SEQ ID:8554, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13030] Another function of GAM83 is therefore inhibition of LOC158125 (Accession XP_088492.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158125.

[13031] LOC202781 (Accession XP_117455.1) is another GAM83 target gene, herein designated TARGET GENE. LOC202781 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC202781, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC202781 BINDING SITE, designated SEQ ID:9377, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13032] Another function of GAM83 is therefore inhibition of LOC202781 (Accession XP_117455.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202781.

[13033] LOC219612 (Accession XP_168585.2) is another GAM83 target gene, herein designated TARGET GENE. LOC219612 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC219612, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219612 BINDING SITE, designated SEQ ID:690, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13034] Another function of GAM83 is therefore inhibition of LOC219612 (Accession XP_168585.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC219612.

[13035] LOC219731 (Accession XP_167596.1) is another GAM83 target gene, herein designated TARGET GENE. LOC219731 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC219731, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219731 BINDING SITE, designated SEQ ID:5054, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13036] Another function of GAM83 is therefore inhibition of LOC219731 (Accession XP_167596.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219731.

[13037] LOC219914 (Accession XP_167788.1) is another GAM83 target gene, herein designated TARGET GENE. LOC219914 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC219914, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC219914 BINDING SITE, designated SEQ ID:15995, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13038] Another function of GAM83 is therefore inhibition of LOC219914 (Accession XP_167788.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219914.

[13039] LOC219942 (Accession XP_167790.1) is another GAM83 target gene, herein designated TARGET GENE. LOC219942 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC219942, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC219942 BINDING SITE, designated SEQ ID:10767, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13040] Another function of GAM83 is therefore inhibition of LOC219942 (Accession XP_167790.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC219942.

[13041] LOC282976 (Accession XP_210838.1) is another GAM83 target gene, herein designated TARGET GENE. LOC282976 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC282976, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC282976 BINDING SITE, designated SEQ ID:2531, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13042] Another function of GAM83 is therefore inhibition of LOC282976 (Accession XP_210838.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC282976.

[13043] LOC283314 (Accession XP_210969.1) is another GAM83 target gene, herein designated TARGET GENE. LOC283314 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283314, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC283314 BINDING SITE, designated SEQ ID:19120, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13044] Another function of GAM83 is therefore inhibition of LOC283314 (Accession XP_210969.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283314.

[13045] LOC283337 (Accession XP_300560.1) is another GAM83 target gene, herein designated TARGET GENE. LOC283337 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283337, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283337 BINDING SITE, designated SEQ ID:7249, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13046] Another function of GAM83 is therefore inhibition of LOC283337 (Accession XP_300560.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283337.

[13047] LOC283484 (Accession XP_211053.1) is another GAM83 target gene, herein designated TARGET GENE. LOC283484 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283484, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283484 BINDING SITE, designated SEQ ID:17012, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13048] Another function of GAM83 is therefore inhibition of LOC283484 (Accession XP_211053.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283484.

[13049] LOC283767 (Accession XP_208835.1) is another GAM83 target gene, herein designated TARGET GENE. LOC283767 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC283767, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283767 BINDING SITE, designated SEQ ID:1502, to

the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13050] Another function of GAM83 is therefore inhibition of LOC283767 (Accession XP_208835.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283767.

[13051] LOC283776 (Accession XP_211196.1) is another GAM83 target gene, herein designated TARGET GENE. LOC283776 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283776, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283776 BINDING SITE, designated SEQ ID:14021, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13052] Another function of GAM83 is therefore inhibition of LOC283776 (Accession XP_211196.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283776.

[13053] LOC283818 (Accession XP_211218.1) is another GAM83

target gene, herein designated TARGET GENE. LOC283818 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283818, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283818 BINDING SITE, designated SEQ ID:3222, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13054] Another function of GAM83 is therefore inhibition of LOC283818 (Accession XP_211218.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283818.

[13055] LOC283906 (Accession XP_211254.1) is another GAM83 target gene, herein designated TARGET GENE. LOC283906 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283906, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283906 BINDING SITE, designated SEQ ID:19383, to the nucleotide sequence of GAM83 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:287.

[13056] Another function of GAM83 is therefore inhibition of LOC283906 (Accession XP_211254.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283906.

[13057] LOC284031 (Accession XP_208982.1) is another GAM83 target gene, herein designated TARGET GENE. LOC284031 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284031, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284031 BINDING SITE, designated SEQ ID:1826, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13058] Another function of GAM83 is therefore inhibition of LOC284031 (Accession XP_208982.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284031.

[13059] LOC284462 (Accession XP_211475.1) is another GAM83 target gene, herein designated TARGET GENE. LOC284462

BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284462, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284462 BINDING SITE, designated SEQ ID:17281, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13060] Another function of GAM83 is therefore inhibition of LOC284462 (Accession XP_211475.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284462.

[13061] LOC284473 (Accession XP_211474.1) is another GAM83 target gene, herein designated TARGET GENE. LOC284473 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284473, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284473 BINDING SITE, designated SEQ ID:7971, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13062] Another function of GAM83 is therefore inhibition of LOC284473 (Accession XP_211474.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284473.

[13063] LOC284578 (Accession XP_211526.1) is another GAM83 target gene, herein designated TARGET GENE. LOC284578 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC284578, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284578 BINDING SITE, designated SEQ ID:13654, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13064] Another function of GAM83 is therefore inhibition of LOC284578 (Accession XP_211526.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284578.

[13065] LOC284671 (Accession XP_209313.2) is another GAM83 target gene, herein designated TARGET GENE. LOC284671 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC284671, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284671 BINDING SITE, designated SEQ ID:1698, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13066] Another function of GAM83 is therefore inhibition of LOC284671 (Accession XP_209313.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284671.

[13067] LOC284684 (Accession XP_209316.1) is another GAM83 target gene, herein designated TARGET GENE. LOC284684 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284684, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284684 BINDING SITE, designated SEQ ID:2205, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13068] Another function of GAM83 is therefore inhibition of

LOC284684 (Accession XP_209316.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284684.

[13069] LOC284775 (Accession XP_211635.1) is another GAM83 target gene, herein designated TARGET GENE. LOC284775 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284775, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284775 BINDING SITE, designated SEQ ID:19513, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13070] Another function of GAM83 is therefore inhibition of LOC284775 (Accession XP_211635.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284775.

[13071] LOC284798 (Accession XP_211639.1) is another GAM83 target gene, herein designated TARGET GENE. LOC284798 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC284798, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC284798 BINDING SITE, designated SEQ ID:18378, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13072] Another function of GAM83 is therefore inhibition of LOC284798 (Accession XP_211639.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC284798.

[13073] LOC285351 (Accession XP_211856.1) is another GAM83 target gene, herein designated TARGET GENE. LOC285351 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC285351, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285351 BINDING SITE, designated SEQ ID:7404, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13074] Another function of GAM83 is therefore inhibition of LOC285351 (Accession XP_211856.1) . Accordingly, utili-

ties of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285351.

[13075] LOC285404 (Accession XP_211885.1) is another GAM83 target gene, herein designated TARGET GENE. LOC285404 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285404, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285404 BINDING SITE, designated SEQ ID:2002, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13076] Another function of GAM83 is therefore inhibition of LOC285404 (Accession XP_211885.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285404.

[13077] LOC285422 (Accession XP_211894.1) is another GAM83 target gene, herein designated TARGET GENE. LOC285422 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285422, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285422 BINDING SITE, designated SEQ ID:5221, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13078] Another function of GAM83 is therefore inhibition of LOC285422 (Accession XP_211894.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285422.

[13079] LOC285441 (Accession XP_211897.1) is another GAM83 target gene, herein designated TARGET GENE. LOC285441 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285441, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285441 BINDING SITE, designated SEQ ID:18486, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13080] Another function of GAM83 is therefore inhibition of LOC285441 (Accession XP_211897.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC285441.

[13081] LOC285548 (Accession XP_211936.1) is another GAM83 target gene, herein designated TARGET GENE. LOC285548 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285548, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285548 BINDING SITE, designated SEQ ID:3710, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13082] Another function of GAM83 is therefore inhibition of LOC285548 (Accession XP_211936.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285548.

[13083] LOC285623 (Accession XP_211958.1) is another GAM83 target gene, herein designated TARGET GENE. LOC285623 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285623, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of LOC285623 BINDING SITE, designated SEQ ID:1605, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13084] Another function of GAM83 is therefore inhibition of LOC285623 (Accession XP_211958.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285623.

[13085] LOC285747 (Accession XP_209742.1) is another GAM83 target gene, herein designated TARGET GENE. LOC285747 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285747, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285747 BINDING SITE, designated SEQ ID:16029, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13086] Another function of GAM83 is therefore inhibition of LOC285747 (Accession XP_209742.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC285747.

[13087] LOC285946 (Accession XP_212103.1) is another GAM83 target gene, herein designated TARGET GENE. LOC285946 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC285946, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC285946 BINDING SITE, designated SEQ ID:19964, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13088] Another function of GAM83 is therefore inhibition of LOC285946 (Accession XP_212103.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC285946.

[13089] LOC286345 (Accession XP_210021.1) is another GAM83 target gene, herein designated TARGET GENE. LOC286345 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286345, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences

of LOC286345 BINDING SITE, designated SEQ ID:1540, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13090] Another function of GAM83 is therefore inhibition of LOC286345 (Accession XP_210021.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286345.

[13091] LOC286452 (Accession XP_212323.1) is another GAM83 target gene, herein designated TARGET GENE. LOC286452 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286452, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286452 BINDING SITE, designated SEQ ID:17170, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13092] Another function of GAM83 is therefore inhibition of LOC286452 (Accession XP_212323.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286452.

[13093] LOC286484 (Accession XP_208434.1) is another GAM83 target gene, herein designated TARGET GENE. LOC286484 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC286484, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC286484 BINDING SITE, designated SEQ ID:14618, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13094] Another function of GAM83 is therefore inhibition of LOC286484 (Accession XP_208434.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC286484.

[13095] LOC338588 (Accession XP_294659.1) is another GAM83 target gene, herein designated TARGET GENE. LOC338588 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC338588, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338588 BINDING SITE, designated SEQ ID:10340, to

the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13096] Another function of GAM83 is therefore inhibition of LOC338588 (Accession XP_294659.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338588.

[13097] LOC338991 (Accession XP_290663.1) is another GAM83 target gene, herein designated TARGET GENE. LOC338991 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338991, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338991 BINDING SITE, designated SEQ ID:1502, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13098] Another function of GAM83 is therefore inhibition of LOC338991 (Accession XP_290663.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338991.

[13099] LOC338999 (Accession XP_290659.1) is another GAM83

target gene, herein designated TARGET GENE. LOC338999 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC338999, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC338999 BINDING SITE, designated SEQ ID:1502, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13100] Another function of GAM83 is therefore inhibition of LOC338999 (Accession XP_290659.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC338999.

[13101] LOC339161 (Accession XP_294835.1) is another GAM83 target gene, herein designated TARGET GENE. LOC339161 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339161, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339161 BINDING SITE, designated SEQ ID:7871, to the nucleotide sequence of GAM83 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:287.

[13102] Another function of GAM83 is therefore inhibition of LOC339161 (Accession XP_294835.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339161.

[13103] LOC339184 (Accession XP_290743.1) is another GAM83 target gene, herein designated TARGET GENE. LOC339184 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC339184, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339184 BINDING SITE, designated SEQ ID:5261, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13104] Another function of GAM83 is therefore inhibition of LOC339184 (Accession XP_290743.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339184.

[13105] LOC339437 (Accession XP_290899.1) is another GAM83 target gene, herein designated TARGET GENE. LOC339437

BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC339437, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC339437 BINDING SITE, designated SEQ ID:19567, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13106] Another function of GAM83 is therefore inhibition of LOC339437 (Accession XP_290899.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC339437.

[13107] LOC340478 (Accession XP_295258.1) is another GAM83 target gene, herein designated TARGET GENE. LOC340478 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC340478, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC340478 BINDING SITE, designated SEQ ID:2003, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13108] Another function of GAM83 is therefore inhibition of LOC340478 (Accession XP_295258.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC340478.

[13109] LOC341744 (Accession XP_296409.1) is another GAM83 target gene, herein designated TARGET GENE. LOC341744 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC341744, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC341744 BINDING SITE, designated SEQ ID:11667, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13110] Another function of GAM83 is therefore inhibition of LOC341744 (Accession XP_296409.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC341744.

[13111] LOC348113 (Accession XP_300623.1) is another GAM83 target gene, herein designated TARGET GENE. LOC348113 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by LOC348113, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348113 BINDING SITE, designated SEQ ID:1502, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13112] Another function of GAM83 is therefore inhibition of LOC348113 (Accession XP_300623.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348113.

[13113] LOC348137 (Accession XP_300635.1) is another GAM83 target gene, herein designated TARGET GENE. LOC348137 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348137, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348137 BINDING SITE, designated SEQ ID:10142, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13114] Another function of GAM83 is therefore inhibition of

LOC348137 (Accession XP_300635.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348137.

[13115] LOC348142 (Accession XP_300636.1) is another GAM83 target gene, herein designated TARGET GENE. LOC348142 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348142, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348142 BINDING SITE, designated SEQ ID:1502, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13116] Another function of GAM83 is therefore inhibition of LOC348142 (Accession XP_300636.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348142.

[13117] LOC348144 (Accession XP_300638.1) is another GAM83 target gene, herein designated TARGET GENE. LOC348144 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348144, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348144 BINDING SITE, designated SEQ ID:18221, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13118] Another function of GAM83 is therefore inhibition of LOC348144 (Accession XP_300638.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348144.

[13119] LOC348182 (Accession XP_302676.1) is another GAM83 target gene, herein designated TARGET GENE. LOC348182 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC348182, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348182 BINDING SITE, designated SEQ ID:11592, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13120] Another function of GAM83 is therefore inhibition of LOC348182 (Accession XP_302676.1) . Accordingly, utili-

ties of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348182.

[13121] LOC348768 (Accession XP_302883.1) is another GAM83 target gene, herein designated TARGET GENE. LOC348768 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC348768, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC348768 BINDING SITE, designated SEQ ID:14195, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13122] Another function of GAM83 is therefore inhibition of LOC348768 (Accession XP_302883.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC348768.

[13123] LOC350132 (Accession XP_303867.1) is another GAM83 target gene, herein designated TARGET GENE. LOC350132 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC350132, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC350132 BINDING SITE, designated SEQ ID:3208, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13124] Another function of GAM83 is therefore inhibition of LOC350132 (Accession XP_303867.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC350132.

[13125] LOC350147 (Accession XP_303825.1) is another GAM83 target gene, herein designated TARGET GENE. LOC350147 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC350147, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC350147 BINDING SITE, designated SEQ ID:15430, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13126] Another function of GAM83 is therefore inhibition of LOC350147 (Accession XP_303825.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC350147.

[13127] LOC351042 (Accession XP_304632.1) is another GAM83 target gene, herein designated TARGET GENE. LOC351042 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC351042, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC351042 BINDING SITE, designated SEQ ID:8285, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13128] Another function of GAM83 is therefore inhibition of LOC351042 (Accession XP_304632.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC351042.

[13129] LOC57107 (Accession NP_065114.2) is another GAM83 target gene, herein designated TARGET GENE. LOC57107 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC57107, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illus-

trates the complementarity of the nucleotide sequences of LOC57107 BINDING SITE, designated SEQ ID:5002, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13130] Another function of GAM83 is therefore inhibition of LOC57107 (Accession NP_065114.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57107.

[13131] LOC90148 (Accession XP_029430.1) is another GAM83 target gene, herein designated TARGET GENE. LOC90148 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC90148, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC90148 BINDING SITE, designated SEQ ID:4641, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13132] Another function of GAM83 is therefore inhibition of LOC90148 (Accession XP_029430.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90148.

[13133] LOC92973 (Accession XP_048529.2) is another GAM83 target gene, herein designated TARGET GENE. LOC92973 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC92973, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC92973 BINDING SITE, designated SEQ ID:14969, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13134] Another function of GAM83 is therefore inhibition of LOC92973 (Accession XP_048529.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92973.

[13135] LOC93349 (Accession NP_612411.2) is another GAM83 target gene, herein designated TARGET GENE. LOC93349 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC93349, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC93349 BINDING SITE, designated SEQ ID:17460, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13136] Another function of GAM83 is therefore inhibition of LOC93349 (Accession NP_612411.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93349.

[13137] LSM10 (Accession NP_116270.1) is another GAM83 target gene, herein designated TARGET GENE. LSM10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LSM10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LSM10 BINDING SITE, designated SEQ ID:918, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13138] Another function of GAM83 is therefore inhibition of LSM10 (Accession NP_116270.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LSM10.

[13139] Lymphotoxin alpha (tnf superfamily, member 1) (LTA, Ac-

cession NP_000586.2) is another GAM83 target gene, herein designated TARGET GENE. LTA BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LTA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LTA BINDING SITE, designated SEQ ID:3286, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13140] Another function of GAM83 is therefore inhibition of Lymphotoxin alpha (tnf superfamily, member 1) (LTA, Accession NP_000586.2), a gene which is a cytokine that in its homotrimeric form binds to tnfrsf1a/tnfr1, tnfrsf1b/tnfbr and tnfrsf14/hvem. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTA.

[13141] The function of LTA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Methyl cpg binding protein 2 (rett syndrome) (MECP2, Accession NP_004983.1) is another GAM83 target gene, herein designated TARGET GENE. MECP2 BINDING SITE is a target binding site found in the 3` untranslated

region of mRNA encoded by MECP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MECP2 BINDING SITE, designated SEQ ID:689, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13142] Another function of GAM83 is therefore inhibition of Methyl cpg binding protein 2 (rett syndrome) (MECP2, Accession NP_004983.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MECP2.

[13143] Meis1, myeloid ecotropic viral integration site 1 homolog (mouse) (MEIS1, Accession NP_002389.1) is another GAM83 target gene, herein designated TARGET GENE. MEIS1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MEIS1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MEIS1 BINDING SITE, designated SEQ ID:12764, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13144] Another function of GAM83 is therefore inhibition of Meis1, myeloid ecotropic viral integration site 1 homolog (mouse) (MEIS1, Accession NP_002389.1), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEIS1.

[13145] The function of MEIS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Microfibrillar-associated protein 2 (MFAP2, Accession NP_059453.1) is another GAM83 target gene, herein designated TARGET GENE. MFAP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MFAP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MFAP2 BINDING SITE, designated SEQ ID:2746, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13146] Another function of GAM83 is therefore inhibition of Microfibrillar-associated protein 2 (MFAP2, Accession

NP_059453.1), a gene which is a component of the elastin- associated microfibrils. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MFAP2.

[13147] The function of MFAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Microfibrillar-associated protein 2 (MFAP2, Accession NP_002394.1) is another GAM83 target gene, herein designated TARGET GENE. MFAP2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MFAP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MFAP2 BINDING SITE, designated SEQ ID:2746, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13148] Another function of GAM83 is therefore inhibition of Microfibrillar-associated protein 2 (MFAP2, Accession NP_002394.1), a gene which is a component of the elastin- associated microfibrils. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with MFAP2.

[13149] The function of MFAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.MGC10646 (Accession NP_116082.1) is another GAM83 target gene, herein designated TARGET GENE. MGC10646 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC10646, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC10646 BINDING SITE, designated SEQ ID:5646, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13150] Another function of GAM83 is therefore inhibition of MGC10646 (Accession NP_116082.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10646.

[13151] MGC12435 (Accession NP_113615.1) is another GAM83 target gene, herein designated TARGET GENE. MGC12435 BINDING SITE is a target binding site found in the 3` un-

translated region of mRNA encoded by MGC12435, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC12435 BINDING SITE, designated SEQ ID:7109, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13152] Another function of GAM83 is therefore inhibition of MGC12435 (Accession NP_113615.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12435.

[13153] MGC13071 (Accession NP_116078.2) is another GAM83 target gene, herein designated TARGET GENE. MGC13071 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC13071, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC13071 BINDING SITE, designated SEQ ID:8673, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13154] Another function of GAM83 is therefore inhibition of

MGC13071 (Accession NP_116078.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13071.

[13155] MGC17515 (Accession NP_689684.1) is another GAM83 target gene, herein designated TARGET GENE. MGC17515 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MGC17515, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC17515 BINDING SITE, designated SEQ ID:16554, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13156] Another function of GAM83 is therefore inhibition of MGC17515 (Accession NP_689684.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC17515.

[13157] MGC2306 (Accession NP_002041.2) is another GAM83 target gene, herein designated TARGET GENE. MGC2306 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC2306, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC2306 BINDING SITE, designated SEQ ID:2059, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13158] Another function of GAM83 is therefore inhibition of MGC2306 (Accession NP_002041.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2306.

[13159] MGC3101 (Accession NP_076948.1) is another GAM83 target gene, herein designated TARGET GENE. MGC3101 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC3101, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC3101 BINDING SITE, designated SEQ ID:6021, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13160] Another function of GAM83 is therefore inhibition of MGC3101 (Accession NP_076948.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with MGC3101.

[13161] MGC33215 (Accession NP_722517.1) is another GAM83 target gene, herein designated TARGET GENE. MGC33215 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC33215, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC33215 BINDING SITE, designated SEQ ID:9985, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13162] Another function of GAM83 is therefore inhibition of MGC33215 (Accession NP_722517.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33215.

[13163] MGC33974 (Accession NP_699181.1) is another GAM83 target gene, herein designated TARGET GENE. MGC33974 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC33974, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MGC33974 BINDING SITE, designated SEQ ID:19531, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13164] Another function of GAM83 is therefore inhibition of MGC33974 (Accession NP_699181.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33974.

[13165] MGC35440 (Accession NP_694952.1) is another GAM83 target gene, herein designated TARGET GENE. MGC35440 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MGC35440, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MGC35440 BINDING SITE, designated SEQ ID:1776, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13166] Another function of GAM83 is therefore inhibition of MGC35440 (Accession NP_694952.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35440.

[13167] Molybdenum cofactor synthesis 3 (MOCS3, Accession NP_055299.1) is another GAM83 target gene, herein designated TARGET GENE. MOCS3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MOCS3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MOCS3 BINDING SITE, designated SEQ ID:4326, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13168] Another function of GAM83 is therefore inhibition of Molybdenum cofactor synthesis 3 (MOCS3, Accession NP_055299.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOCS3.

[13169] Mitochondrial ribosomal protein l21 (MRPL21, Accession NP_852616.1) is another GAM83 target gene, herein designated TARGET GENE. MRPL21 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MRPL21, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

MRPL21 BINDING SITE, designated SEQ ID:1724, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13170] Another function of GAM83 is therefore inhibition of Mitochondrial ribosomal protein l21 (MRPL21, Accession NP_852616.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL21.

[13171] Mitochondrial ribosomal protein l30 (MRPL30, Accession NP_660213.1) is another GAM83 target gene, herein designated TARGET GENE. MRPL30 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MRPL30, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MRPL30 BINDING SITE, designated SEQ ID:8553, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13172] Another function of GAM83 is therefore inhibition of Mitochondrial ribosomal protein l30 (MRPL30, Accession NP_660213.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with MRPL30.

[13173] Myosin, light polypeptide 9, regulatory (MYL9, Accession NP_852667.1) is another GAM83 target gene, herein designated TARGET GENE. MYL9 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MYL9, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYL9 BINDING SITE, designated SEQ ID:1500, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13174] Another function of GAM83 is therefore inhibition of Myosin, light polypeptide 9, regulatory (MYL9, Accession NP_852667.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYL9.

[13175] Myosin, light polypeptide 9, regulatory (MYL9, Accession NP_006088.2) is another GAM83 target gene, herein designated TARGET GENE. MYL9 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MYL9, corresponding to a target binding site such as BINDING SITE I, BINDING

SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of MYL9 BINDING SITE, designated SEQ ID:1500, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13176] Another function of GAM83 is therefore inhibition of Myosin, light polypeptide 9, regulatory (MYL9, Accession NP_006088.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYL9.

[13177] Neural cell adhesion molecule 2 (NCAM2, Accession NP_004531.1) is another GAM83 target gene, herein designated TARGET GENE. NCAM2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NCAM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NCAM2 BINDING SITE, designated SEQ ID:15637, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13178] Another function of GAM83 is therefore inhibition of Neural cell adhesion molecule 2 (NCAM2, Accession

NP_004531.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCAM2.

[13179] Nima (never in mitosis gene a)-related kinase 6 (NEK6, Accession NP_055212.2) is another GAM83 target gene, herein designated TARGET GENE. NEK6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NEK6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NEK6 BINDING SITE, designated SEQ ID:1469, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13180] Another function of GAM83 is therefore inhibition of Nima (never in mitosis gene a)-related kinase 6 (NEK6, Accession NP_055212.2), a gene which regulates nuclear and cytoplasmic aspects of the mitotic cycle. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEK6.

[13181] The function of NEK6 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to GAM44.1.NFASC (Accession XP_046808.8) is another GAM83 target gene, herein designated TARGET GENE. NFASC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NFASC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NFASC BINDING SITE, designated SEQ ID:8725, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13182] Another function of GAM83 is therefore inhibition of NFASC (Accession XP_046808.8) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFASC.

[13183] NK4 (Accession NP_004212.3) is another GAM83 target gene, herein designated TARGET GENE. NK4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NK4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NK4 BINDING SITE, designated SEQ ID:19318, to the nucleotide se-

quence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13184] Another function of GAM83 is therefore inhibition of NK4 (Accession NP_004212.3) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NK4.

[13185] NP220 (Accession NP_055312.2) is another GAM83 target gene, herein designated TARGET GENE. NP220 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NP220, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NP220 BINDING SITE, designated SEQ ID:9969, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13186] Another function of GAM83 is therefore inhibition of NP220 (Accession NP_055312.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NP220.

[13187] Neuronal pentraxin receptor (NPTXR, Accession NP_055108.2) is another GAM83 target gene, herein designated TARGET GENE. NPTXR BINDING SITE is a target

binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NPTXR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NPTXR BINDING SITE, designated SEQ ID:3192, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13188] Another function of GAM83 is therefore inhibition of Neuronal pentraxin receptor (NPTXR, Accession NP_055108.2). Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTXR.

[13189] Neuronal pentraxin receptor (NPTXR, Accession NP_478058.1) is another GAM83 target gene, herein designated TARGET GENE. NPTXR BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by NPTXR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of NPTXR BINDING SITE, designated SEQ ID:3192, to the nucleotide sequence of GAM83 RNA, herein designated GAM

RNA, also designated SEQ ID:287.

[13190] Another function of GAM83 is therefore inhibition of Neuronal pentraxin receptor (NPTXR, Accession NP_478058.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTXR.

[13191] Purinergic receptor p2x, ligand-gated ion channel, 5 (P2RX5, Accession NP_778255.1) is another GAM83 target gene, herein designated TARGET GENE. P2RX5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by P2RX5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P2RX5 BINDING SITE, designated SEQ ID:4268, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13192] Another function of GAM83 is therefore inhibition of Purinergic receptor p2x, ligand-gated ion channel, 5 (P2RX5, Accession NP_778255.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RX5.

[13193] Purinergic receptor p2x, ligand-gated ion channel, 5

(P2RX5, Accession NP_002552.2) is another GAM83 target gene, herein designated TARGET GENE. P2RX5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by P2RX5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of P2RX5 BINDING SITE, designated SEQ ID:4268, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13194] Another function of GAM83 is therefore inhibition of Purinergic receptor p2x, ligand-gated ion channel, 5 (P2RX5, Accession NP_002552.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RX5.

[13195] Phosphodiesterase 5a, cgmp-specific (PDE5A, Accession NP_246273.1) is another GAM83 target gene, herein designated TARGET GENE. PDE5A BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PDE5A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

PDE5A BINDING SITE, designated SEQ ID:19020, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13196] Another function of GAM83 is therefore inhibition of Phosphodiesterase 5a, cgmp-specific (PDE5A, Accession NP_246273.1), a gene which plays a role in signal transduction by regulating the intracellular concentration of cyclic nucleotides . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE5A.

[13197] The function of PDE5A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Pellino homolog 2 (drosophila) (PELI2, Accession NP_067078.1) is another GAM83 target gene, herein designated TARGET GENE. PELI2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PELI2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PELI2 BINDING SITE, designated SEQ ID:7435, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13198] Another function of GAM83 is therefore inhibition of Pellino homolog 2 (drosophila) (PELI2, Accession NP_067078.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI2.

[13199] Peptidase d (PEPD, Accession NP_000276.1) is another GAM83 target gene, herein designated TARGET GENE. PEPD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PEPD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PEPD BINDING SITE, designated SEQ ID:4327, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13200] Another function of GAM83 is therefore inhibition of Peptidase d (PEPD, Accession NP_000276.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEPD.

[13201] PILRB (Accession NP_778212.2) is another GAM83 target gene, herein designated TARGET GENE. PILRB BINDING SITE is a target binding site found in the 5` untranslated

region of multiple transcripts of mRNA encoded by PILRB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PILRB BINDING SITE, designated SEQ ID:5459, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13202] Another function of GAM83 is therefore inhibition of PILRB (Accession NP_778212.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PILRB.

[13203] PILRB (Accession NP_038468.3) is another GAM83 target gene, herein designated TARGET GENE. PILRB BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PILRB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PILRB BINDING SITE, designated SEQ ID:5459, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13204] Another function of GAM83 is therefore inhibition of PILRB (Accession NP_038468.3) . Accordingly, utilities of GAM83

include diagnosis, prevention and treatment of diseases and clinical conditions associated with PILRB.

[13205] Pogo transposable element with znf domain (POGZ, Accession NP_055915.1) is another GAM83 target gene, herein designated TARGET GENE. POGZ BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by POGZ, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POGZ BINDING SITE, designated SEQ ID:11143, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13206] Another function of GAM83 is therefore inhibition of Pogo transposable element with znf domain (POGZ, Accession NP_055915.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POGZ.

[13207] Polymerase (rna) ii (dna directed) polypeptide d (POLR2D, Accession NP_004796.1) is another GAM83 target gene, herein designated TARGET GENE. POLR2D BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by POLR2D, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POLR2D BINDING SITE, designated SEQ ID:4052, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13208] Another function of GAM83 is therefore inhibition of Polymerase (rna) ii (dna directed) polypeptide d (POLR2D, Accession NP_004796.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLR2D.

[13209] Pou domain, class 2, associating factor 1 (POU2AF1, Accession NP_006226.1) is another GAM83 target gene, herein designated TARGET GENE. POU2AF1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by POU2AF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of POU2AF1 BINDING SITE, designated SEQ ID:16639, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13210] Another function of GAM83 is therefore inhibition of Pou

domain, class 2, associating factor 1 (POU2AF1, Accession NP_006226.1), a gene which is a transcriptional coactivator that specifically associates with either oct1 or oct2 and therefore may be associated with A form of b- cell leukemia. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of A form of b- cell leukemia, and of other diseases and clinical conditions associated with POU2AF1.

[13211] The function of POU2AF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM30.1.Protein phosphatase 1, regulatory (inhibitor) subunit 3a (glycogen and sarcoplasmic reticulum binding subunit, skeletal muscle) (PPP1R3A, Accession NP_002702.1) is another GAM83 target gene, herein designated TARGET GENE. PPP1R3A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PPP1R3A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PPP1R3A BINDING SITE, designated SEQ ID:20165, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated

SEQ ID:287.

[13212] Another function of GAM83 is therefore inhibition of Protein phosphatase 1, regulatory (inhibitor) subunit 3a (glycogen and sarcoplasmic reticulum binding subunit, skeletal muscle) (PPP1R3A, Accession NP_002702.1), a gene which regulates phosphatase activity towards glycogen synthase, active in skeletal muscle and therefore may be associated with Insulin resistance and glycemia variation. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Insulin resistance and glycemia variation, and of other diseases and clinical conditions associated with PPP1R3A.

[13213] The function of PPP1R3A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Pr domain containing 2, with znf domain (PRDM2, Accession NP_056950.2) is another GAM83 target gene, herein designated TARGET GENE. PRDM2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PRDM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nu-

cleotide sequences of PRDM2 BINDING SITE, designated SEQ ID:12854, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13214] Another function of GAM83 is therefore inhibition of Pr domain containing 2, with znf domain (PRDM2, Accession NP_056950.2), a gene which plays a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. and therefore may be associated with Tumor. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Tumor, and of other diseases and clinical conditions associated with PRDM2.

[13215] The function of PRDM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Protein kinase c, nu (PRKCN, Accession NP_005804.1) is another GAM83 target gene, herein designated TARGET GENE. PRKCN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRKCN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRKCN BINDING SITE, designated SEQ ID:19159, to the nucleotide sequence of GAM83 RNA,

herein designated GAM RNA, also designated SEQ ID:287.

[13216] Another function of GAM83 is therefore inhibition of Protein kinase c, nu (PRKCN, Accession NP_005804.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCN.

[13217] PRO0461 (Accession NP_112558.1) is another GAM83 target gene, herein designated TARGET GENE. PRO0461 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PRO0461, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PRO0461 BINDING SITE, designated SEQ ID:19001, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13218] Another function of GAM83 is therefore inhibition of PRO0461 (Accession NP_112558.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0461.

[13219] Pyrroline-5-carboxylate reductase 1 (PYCR1, Accession NP_008838.2) is another GAM83 target gene, herein designated TARGET GENE. PYCR1 BINDING SITE1 and PYCR1

BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by PYCR1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PYCR1 BINDING SITE1 and PYCR1 BINDING SITE2, designated SEQ ID:17062 and SEQ ID:7092 respectively, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13220] Another function of GAM83 is therefore inhibition of Pyrroline-5-carboxylate reductase 1 (PYCR1, Accession NP_008838.2), a gene which catalyzes the NAD(P)H- dependent conversion of pyrroline- 5- carboxylate to proline. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYCR1.

[13221] The function of PYCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Rab11-FIP2 (Accession NP_055719.1) is another GAM83 target gene, herein designated TARGET GENE. Rab11-FIP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by

Rab11-FIP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of Rab11-FIP2 BINDING SITE, designated SEQ ID:7165, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13222] Another function of GAM83 is therefore inhibition of Rab11-FIP2 (Accession NP_055719.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP2.

[13223] Rab39b, member ras oncogene family (RAB39B, Accession NP_741995.1) is another GAM83 target gene, herein designated TARGET GENE. RAB39B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAB39B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAB39B BINDING SITE, designated SEQ ID:14419, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13224] Another function of GAM83 is therefore inhibition of Rab39b, member ras oncogene family (RAB39B, Accession NP_741995.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB39B.

[13225] Rap1b, member of ras oncogene family (RAP1B, Accession NP_056461.1) is another GAM83 target gene, herein designated TARGET GENE. RAP1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAP1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAP1B BINDING SITE, designated SEQ ID:7459, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13226] Another function of GAM83 is therefore inhibition of Rap1b, member of ras oncogene family (RAP1B, Accession NP_056461.1), a gene which induces morphological reversion of a cell line transformed by a ras oncogene. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1B.

[13227] The function of RAP1B and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Rap2a, member of ras oncogene family (RAP2A, Accession NP_066361.1) is another GAM83 target gene, herein designated TARGET GENE. RAP2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAP2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RAP2A BINDING SITE, designated SEQ ID:12939, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13228] Another function of GAM83 is therefore inhibition of Rap2a, member of ras oncogene family (RAP2A, Accession NP_066361.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP2A.

[13229] Ras guanyl releasing protein 2 (calcium and dag-regulated) (RASGRP2, Accession NP_722541.1) is another GAM83 target gene, herein designated TARGET GENE. RASGRP2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of

mRNA encoded by RASGRP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASGRP2 BINDING SITE, designated SEQ ID:18244, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13230] Another function of GAM83 is therefore inhibition of Ras guanyl releasing protein 2 (calcium and dag-regulated) (RASGRP2, Accession NP_722541.1), a gene which promotes the exchange of ras- bound gdp by gtp. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP2.

[13231] The function of RASGRP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Ras guanyl releasing protein 2 (calcium and dag-regulated) (RASGRP2, Accession NP_005816.2) is another GAM83 target gene, herein designated TARGET GENE. RASGRP2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by RASGRP2, corresponding to a target

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RASGRP2 BINDING SITE, designated SEQ ID:18244, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13232] Another function of GAM83 is therefore inhibition of Ras guanyl releasing protein 2 (calcium and dag-regulated) (RASGRP2, Accession NP_005816.2), a gene which promotes the exchange of ras- bound gdp by gtp. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP2.

[13233] The function of RASGRP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Ring finger protein 1 (RING1, Accession NP_002922.1) is another GAM83 target gene, herein designated TARGET GENE. RING1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by RING1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the

nucleotide sequences of RING1 BINDING SITE, designated SEQ ID:11106, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13234] Another function of GAM83 is therefore inhibition of Ring finger protein 1 (RING1, Accession NP_002922.1), a gene which involves in transcriptional regulation. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RING1.

[13235] The function of RING1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.RNF39 (Accession NP_079512.1) is another GAM83 target gene, herein designated TARGET GENE. RNF39 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RNF39, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF39 BINDING SITE, designated SEQ ID:5743, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13236] Another function of GAM83 is therefore inhibition of

RNF39 (Accession NP_079512.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF39.

[13237] RNF39 (Accession NP_739575.1) is another GAM83 target gene, herein designated TARGET GENE. RNF39 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by RNF39, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RNF39 BINDING SITE, designated SEQ ID:5743, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13238] Another function of GAM83 is therefore inhibition of RNF39 (Accession NP_739575.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF39.

[13239] SALPR (Accession NP_057652.1) is another GAM83 target gene, herein designated TARGET GENE. SALPR BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SALPR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the com-

plementarity of the nucleotide sequences of SALPR BINDING SITE, designated SEQ ID:1044, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13240] Another function of GAM83 is therefore inhibition of SALPR (Accession NP_057652.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SALPR.

[13241] Spinocerebellar ataxia 1 (olivopontocerebellar ataxia 1, autosomal dominant, ataxin 1) (SCA1, Accession NP_000323.1) is another GAM83 target gene, herein designated TARGET GENE. SCA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCA1 BINDING SITE, designated SEQ ID:17933, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13242] Another function of GAM83 is therefore inhibition of Spinocerebellar ataxia 1 (olivopontocerebellar ataxia 1, autosomal dominant, ataxin 1) (SCA1, Accession NP_000323.1) . Accordingly, utilities of GAM83 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SCA1.

[13243] Sodium channel, nonvoltage-gated 1 alpha (SCNN1A, Accession NP_001029.1) is another GAM83 target gene, herein designated TARGET GENE. SCNN1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SCNN1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SCNN1A BINDING SITE, designated SEQ ID:16640, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13244] Another function of GAM83 is therefore inhibition of Sodium channel, nonvoltage-gated 1 alpha (SCNN1A, Accession NP_001029.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCNN1A.

[13245] Sema domain, immunoglobulin domain (ig), transmembrane domain (tm) and short cytoplasmic domain, (semaphorin) 4c (SEMA4C, Accession NP_060259.2) is another GAM83 target gene, herein designated TARGET GENE. SEMA4C BINDING SITE is a target binding site found

in the 5` untranslated region of mRNA encoded by SEMA4C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SEMA4C BINDING SITE, designated SEQ ID:13121, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13246] Another function of GAM83 is therefore inhibition of Sema domain, immunoglobulin domain (ig), transmembrane domain (tm) and short cytoplasmic domain, (semaphorin) 4c (SEMA4C, Accession NP_060259.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4C.

[13247] Splicing factor, arginine/serine-rich 2, interacting protein (SFRS2IP, Accession NP_004710.1) is another GAM83 target gene, herein designated TARGET GENE. SFRS2IP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SFRS2IP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SFRS2IP BINDING SITE, designated SEQ ID:13515, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA,

also designated SEQ ID:287.

[13248] Another function of GAM83 is therefore inhibition of Splicing factor, arginine/serine-rich 2, interacting protein (SFRS2IP, Accession NP_004710.1), a gene which plays an essential role in pre- mRNA splicing. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS2IP.

[13249] The function of SFRS2IP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_006270.1) is another GAM83 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13250] Another function of GAM83 is therefore inhibition of Sia-

lyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_006270.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[13251] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777627.1) is another GAM83 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13252] Another function of GAM83 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777627.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[13253] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777628.1) is another GAM83 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13254] Another function of GAM83 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777628.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[13255] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777624.1) is another GAM83 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of

mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13256] Another function of GAM83 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777624.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[13257] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777629.1) is another GAM83 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of

GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13258] Another function of GAM83 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777629.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[13259] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777631.1) is another GAM83 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13260] Another function of GAM83 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777631.1) .

Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[13261] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777623.1) is another GAM83 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13262] Another function of GAM83 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777623.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[13263] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777626.1) is

another GAM83 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13264] Another function of GAM83 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777626.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[13265] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777630.1) is another GAM83 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13266] Another function of GAM83 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777630.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[13267] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777632.1) is another GAM83 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13268] Another function of GAM83 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777632.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT6.

[13269] Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777625.1) is another GAM83 target gene, herein designated TARGET GENE. SIAT6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SIAT6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SIAT6 BINDING SITE, designated SEQ ID:8130, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13270] Another function of GAM83 is therefore inhibition of Sialyltransferase 6 (n-acetyllacosaminide alpha 2,3-sialyltransferase) (SIAT6, Accession NP_777625.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with SIAT6.

[13271] SLC30A7 (Accession NP_598003.1) is another GAM83 target gene, herein designated TARGET GENE. SLC30A7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC30A7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SLC30A7 BINDING SITE, designated SEQ ID:7436, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13272] Another function of GAM83 is therefore inhibition of SLC30A7 (Accession NP_598003.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC30A7.

[13273] Syntrophin, gamma 2 (SNTG2, Accession NP_061841.1) is another GAM83 target gene, herein designated TARGET GENE. SNTG2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNTG2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SNTG2 BINDING

SITE, designated SEQ ID:9285, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13274] Another function of GAM83 is therefore inhibition of Syntrophin, gamma 2 (SNTG2, Accession NP_061841.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNTG2.

[13275] Sry (sex determining region y)-box 4 (SOX4, Accession NP_003098.1) is another GAM83 target gene, herein designated TARGET GENE. SOX4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SOX4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SOX4 BINDING SITE, designated SEQ ID:9249, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13276] Another function of GAM83 is therefore inhibition of Sry (sex determining region y)-box 4 (SOX4, Accession NP_003098.1), a gene which binds with high affinity to the t- cell enhancer motif 5'- aacaaag- 3' motif. Accordingly, utilities of GAM83 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with SOX4.

[13277] The function of SOX4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Sry (sex determining region y)-box 7 (SOX7, Accession NP_113627.1) is another GAM83 target gene, herein designated TARGET GENE. SOX7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SOX7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SOX7 BINDING SITE, designated SEQ ID:4922, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13278] Another function of GAM83 is therefore inhibition of Sry (sex determining region y)-box 7 (SOX7, Accession NP_113627.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX7.

[13279] SPRR4 (Accession NP_775103.1) is another GAM83 target gene, herein designated TARGET GENE. SPRR4 BINDING

SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SPRR4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SPRR4 BINDING SITE, designated SEQ ID:1276, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13280] Another function of GAM83 is therefore inhibition of SPRR4 (Accession NP_775103.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRR4.

[13281] Signal recognition particle receptor ('docking protein') (SRPR, Accession NP_003130.2) is another GAM83 target gene, herein designated TARGET GENE. SRPR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SRPR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SRPR BINDING SITE, designated SEQ ID:14130, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13282] Another function of GAM83 is therefore inhibition of Signal recognition particle receptor ('docking protein') (SRPR, Accession NP_003130.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRPR.

[13283] Sjogren syndrome antigen a1 (52kda, ribonucleoprotein autoantigen ss-a/ro) (SSA1, Accession NP_003132.2) is another GAM83 target gene, herein designated TARGET GENE. SSA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SSA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SSA1 BINDING SITE, designated SEQ ID:18743, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13284] Another function of GAM83 is therefore inhibition of Sjogren syndrome antigen a1 (52kda, ribonucleoprotein autoantigen ss-a/ro) (SSA1, Accession NP_003132.2), a gene which is a Minor component of Ro/SSA ribonucleoprotein complexes, recognized by autoantibodies and therefore may be associated with Systemic lupus erythematosus and sjogren syndrome. Accordingly, utilities of GAM83 include

diagnosis, prevention and treatment of Systemic lupus erythematosus and sjogren syndrome., and of other diseases and clinical conditions associated with SSA1.

[13285] The function of SSA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Signal transducer and activator of transcription 1, 91kda (STAT1, Accession NP_644671.1) is another GAM83 target gene, herein designated TARGET GENE. STAT1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by STAT1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STAT1 BINDING SITE, designated SEQ ID:15202, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13286] Another function of GAM83 is therefore inhibition of Signal transducer and activator of transcription 1, 91kda (STAT1, Accession NP_644671.1), a gene which is involved in transcriptional regulation. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT1.

[13287] The function of STAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.STHM (Accession NP_006447.1) is another GAM83 target gene, herein designated TARGET GENE. STHM BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by STHM, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of STHM BINDING SITE, designated SEQ ID:1189, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13288] Another function of GAM83 is therefore inhibition of STHM (Accession NP_006447.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STHM.

[13289] Suppressor of ty 4 homolog 1 (s. cerevisiae) (SUPT4H1, Accession NP_003159.1) is another GAM83 target gene, herein designated TARGET GENE. SUPT4H1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SUPT4H1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II

or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SUPT4H1 BINDING SITE, designated SEQ ID:16861, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13290] Another function of GAM83 is therefore inhibition of Suppressor of ty 4 homolog 1 (s. cerevisiae) (SUPT4H1, Accession NP_003159.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUPT4H1.

[13291] Supervillin (SVIL, Accession NP_003165.1) is another GAM83 target gene, herein designated TARGET GENE. SVIL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SVIL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SVIL BINDING SITE, designated SEQ ID:2228, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13292] Another function of GAM83 is therefore inhibition of Supervillin (SVIL, Accession NP_003165.1), a gene which binds actin, links filamentous actin with the plasma mem-

brane; and contains putative nuclear localization signals. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SVIL.

[13293] The function of SVIL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Supervillin (SVIL, Accession NP_068506.1) is another GAM83 target gene, herein designated TARGET GENE. SVIL BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SVIL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of SVIL BINDING SITE, designated SEQ ID:2228, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13294] Another function of GAM83 is therefore inhibition of Supervillin (SVIL, Accession NP_068506.1), a gene which binds actin, links filamentous actin with the plasma membrane; and contains putative nuclear localization signals. Accordingly, utilities of GAM83 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with SVIL.

[13295] The function of SVIL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.TARSH (Accession NP_079077.1) is another GAM83 target gene, herein designated TARGET GENE. TARSH BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TARSH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TARSH BINDING SITE, designated SEQ ID:14655, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13296] Another function of GAM83 is therefore inhibition of TARSH (Accession NP_079077.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TARSH.

[13297] Treacher collins-franceschetti syndrome 1 (TCOF1, Accession NP_000347.1) is another GAM83 target gene, herein designated TARGET GENE. TCOF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by TCOF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TCOF1 BINDING SITE, designated SEQ ID:12765, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13298] Another function of GAM83 is therefore inhibition of Treacher collins-franceschetti syndrome 1 (TCOF1, Accession NP_000347.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCOF1.

[13299] TD-60 (Accession NP_061185.1) is another GAM83 target gene, herein designated TARGET GENE. TD-60 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TD-60, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TD-60 BINDING SITE, designated SEQ ID:17170, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13300] Another function of GAM83 is therefore inhibition of TD-60 (Accession NP_061185.1) . Accordingly, utilities of

GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TD-60.

[13301] Trinucleotide repeat containing 6 (TNRC6, Accession NP_065898.1) is another GAM83 target gene, herein designated TARGET GENE. TNRC6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNRC6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNRC6 BINDING SITE, designated SEQ ID:3142, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13302] Another function of GAM83 is therefore inhibition of Trinucleotide repeat containing 6 (TNRC6, Accession NP_065898.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC6.

[13303] Trinucleotide repeat containing 6 (TNRC6, Accession NP_055309.1) is another GAM83 target gene, herein designated TARGET GENE. TNRC6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNRC6, correspond-

ing to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TNRC6 BINDING SITE, designated SEQ ID:3142, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13304] Another function of GAM83 is therefore inhibition of Trinucleotide repeat containing 6 (TNRC6, Accession NP_055309.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC6.

[13305] TP53I11 (Accession NP_006025.1) is another GAM83 target gene, herein designated TARGET GENE. TP53I11 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TP53I11, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TP53I11 BINDING SITE, designated SEQ ID:10684, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13306] Another function of GAM83 is therefore inhibition of TP53I11 (Accession NP_006025.1) . Accordingly, utilities

of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53I11.

[13307] Tripartite motif-containing 37 (TRIM37, Accession NP_056109.1) is another GAM83 target gene, herein designated TARGET GENE. TRIM37 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRIM37, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIM37 BINDING SITE, designated SEQ ID:19079, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13308] Another function of GAM83 is therefore inhibition of Tripartite motif-containing 37 (TRIM37, Accession NP_056109.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM37.

[13309] TRIP-Br2 (Accession NP_055570.1) is another GAM83 target gene, herein designated TARGET GENE. TRIP-Br2 BINDING SITE1 and TRIP-Br2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TRIP-Br2, corresponding to target binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE1 and TRIP-Br2 BINDING SITE2, designated SEQ ID:1237 and SEQ ID:18572 respectively, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13310] Another function of GAM83 is therefore inhibition of TRIP-Br2 (Accession NP_055570.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2.

[13311] TUBA3 (Accession NP_006000.2) is another GAM83 target gene, herein designated TARGET GENE. TUBA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TUBA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TUBA3 BINDING SITE, designated SEQ ID:7845, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13312] Another function of GAM83 is therefore inhibition of TUBA3 (Accession NP_006000.2), a gene which is the ma-

jor constituent of microtubules. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUBA3.

[13313] The function of TUBA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.TWISTNB (Accession XP_166508.1) is another GAM83 target gene, herein designated TARGET GENE. TWISTNB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TWISTNB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TWISTNB BINDING SITE, designated SEQ ID:8569, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13314] Another function of GAM83 is therefore inhibition of TWISTNB (Accession XP_166508.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TWISTNB.

[13315] Ubiquitin-conjugating enzyme e2 variant 1 (UBE2V1, Accession NP_068823.1) is another GAM83 target gene, herein designated TARGET GENE. UBE2V1 BINDING SITE is

a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UBE2V1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE, designated SEQ ID:8971, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13316] Another function of GAM83 is therefore inhibition of Ubiquitin-conjugating enzyme e2 variant 1 (UBE2V1, Accession NP_068823.1), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1.

[13317] The function of UBE2V1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Ubiquitin-conjugating enzyme e2 variant 1 (UBE2V1, Accession NP_071887.1) is another GAM83 target gene, herein designated TARGET GENE. UBE2V1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UBE2V1, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE, designated SEQ ID:8971, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13318] Another function of GAM83 is therefore inhibition of Ubiquitin-conjugating enzyme e2 variant 1 (UBE2V1, Accession NP_071887.1), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1.

[13319] The function of UBE2V1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Ubiquitin-conjugating enzyme e2 variant 1 (UBE2V1, Accession NP_003340.1) is another GAM83 target gene, herein designated TARGET GENE. UBE2V1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by UBE2V1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE, designated

SEQ ID:8971, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13320] Another function of GAM83 is therefore inhibition of Ubiquitin-conjugating enzyme e2 variant 1 (UBE2V1, Accession NP_003340.1), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1.

[13321] The function of UBE2V1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.1.Ubinuclein 1 (UBN1, Accession NP_058632.1) is another GAM83 target gene, herein designated TARGET GENE. UBN1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by UBN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of UBN1 BINDING SITE, designated SEQ ID:17578, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13322] Another function of GAM83 is therefore inhibition of Ubinuclein 1 (UBN1, Accession NP_058632.1) . Accord-

ingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBN1.

[13323] WBP3 (Accession NP_783863.2) is another GAM83 target gene, herein designated TARGET GENE. WBP3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by WBP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of WBP3 BINDING SITE, designated SEQ ID:1501, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13324] Another function of GAM83 is therefore inhibition of WBP3 (Accession NP_783863.2) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBP3.

[13325] Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase activation protein, gamma polypeptide (YWHAG, Accession NP_036611.2) is another GAM83 target gene, herein designated TARGET GENE. YWHAG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by YWHAG, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of YWHAG BINDING SITE, designated SEQ ID:15404, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13326] Another function of GAM83 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase activation protein, gamma polypeptide (YWHAG, Accession NP_036611.2), a gene which mediates mitogenic signals of PDGF in vascular smooth muscle cells. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAG.

[13327] The function of YWHAG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM40.1.ZFYVE26 (Accession XP_031077.1) is another GAM83 target gene, herein designated TARGET GENE. ZFYVE26 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ZFYVE26, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4

illustrates the complementarity of the nucleotide sequences of ZFYVE26 BINDING SITE, designated SEQ ID:7546, to the nucleotide sequence of GAM83 RNA, herein designated GAM RNA, also designated SEQ ID:287.

[13328] Another function of GAM83 is therefore inhibition of ZFYVE26 (Accession XP_031077.1) . Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFYVE26.

[13329]

[13330] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 84 (GAM84), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13331] GAM84 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM84 was detected is described hereinabove with reference to Figs. 8-15.

[13332] GAM84 gene, herein designated GAM GENE, and GAM84 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[13333] GAM84 gene encodes a GAM84 precursor RNA, herein

designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM84 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM84 precursor RNA is designated SEQ ID:98, and is provided hereinbelow with reference to the sequence listing part.

[13334] GAM84 precursor RNA folds onto itself, forming GAM84 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13335] GAM84 precursor RNA folds onto itself, forming GAM84 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[13336] Nucleotide sequence of GAM84 precursor RNA, designated SEQ-ID: 98, and a schematic representation of a predicted secondary folding of GAM84 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[13337] An enzyme complex designated DICER COMPLEX, `dices` the GAM84 folded precursor RNA into GAM84 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM84 RNA is designated SEQ ID:204, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[13338] GAM84 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM84 target RNA, herein designated GAM TARGET RNA. GAM84 target RNA comprises three regions, as is typical of mRNA of a

protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13339] GAM84 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM84 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM84 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM84 RNA may have a different number of target binding sites in untranslated regions of a GAM84 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13340] The complementary binding of GAM84 RNA, herein desig-

nated GAM RNA, to target binding sites on GAM84 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM84 target RNA into GAM84 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13341] It is appreciated that GAM84 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM84 target genes. The mRNA of each one of this plurality of GAM84 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM84 RNA, herein designated GAM RNA, and which when bound by GAM84 RNA causes inhibition of translation of respective one or more GAM84 target proteins.

[13342] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM84 gene, herein designated GAM GENE, on one or more GAM84 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary bind-

ing site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13343] It is appreciated that specific functions and accordingly utilities of GAM84 correlate with, and may be deduced from, the identity of the target genes which GAM84 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13344]

[13345]

[13346] APPD (Accession) is a GAM84 target gene, herein designated TARGET GENE. APPD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of APPD BINDING SITE, designated

SEQ ID:10016, to the nucleotide sequence of GAM84 RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13347] A function of GAM84 is therefore inhibition of APPD (Accession) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APPD.

[13348] Digeorge syndrome critical region gene 2 (DGCR2, Accession NM_005137.1) is another GAM84 target gene, herein designated TARGET GENE. DGCR2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DGCR2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DGCR2 BINDING SITE, designated SEQ ID:6302, to the nucleotide sequence of GAM84 RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13349] Another function of GAM84 is therefore inhibition of Digeorge syndrome critical region gene 2 (DGCR2, Accession NM_005137.1), a gene which is putative adhesion receptor and intervenes in cell- cell or cell- matrix interactions and therefore may be associated with Digeorge syndrome . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of Digeorge syndrome ., and of

other diseases and clinical conditions associated with DGCR2.

[13350] The function of DGCR2 has been established by previous studies. Demczuk et al. (1995) cloned 1 breakpoint in a balanced t(2;22)(q14.1;q11.1) translocation found in a daughter and her mother with DiGeorge syndrome/ velocardiofacial syndrome phenotypes (see OMIM Ref. No. 188400; Augusseau et al., 1986). They reported the isolation of a gene encoding a potential adhesion receptor protein. The gene did not encompass the breakpoint, but its 3- prime end mapped only 10 kb telomeric to the balanced translocation. They proposed to designate this gene as DGCR2; the TUPLE1 (OMIM Ref. No. 600237) gene isolated from the same region would then be DGCR1. Analysis of the DGCR2 sequence led Demczuk et al. (1995) to propose a mechanism by which the protein could be etiologic in CATCH22 (see OMIM Ref. No. 188400). The cephalic neural crest cells have been shown to contribute to the aorticopulmonary septation and to the morphogenesis of the thymus and parathyroids. Therefore, DiGeorge syndrome has been classified as a neurocristopathy. Altered levels of adhesion receptors due to haploinsufficiency for the DGCR2 protein might interfere with migra-

tion of neural crest cells. ADU were the initials of a patient with DiGeorge syndrome (OMIM Ref. No. 188400) in whom was found a balanced translocation with a breakpoint within 22q11, the shortest region of deletion overlap for this disorder. Wadey et al. (1995) isolated a P1 clone that spanned this breakpoint (also called the ADU breakpoint) and used it to isolate a cDNA encoding a transmembrane protein expressed in a wide variety of tissues. This gene, called IDD (integral membrane protein, deleted in DGS), was not disrupted by the translocation but mapped within 10 kb of the breakpoint. Mutation analysis in 5 cases of DiGeorge syndrome with no previously identified chromosome 22 deletion yielded negative results, but a possible protein polymorphism was discovered. No deletions or rearrangements were detected in these patients following analysis with markers closely flanking the breakpoint, data that emphasized the large (over 1 Mb) interstitial deletions that are the rule in DGS. Wadey et al. (1995) speculated that, although the mutation analysis was negative, the proximity of IDD to the balanced translocation breakpoint and its position within the shortest region of deletion overlap indicated that the gene may have a role, along with other genes, in the CATCH22 haploinsuffi-

ciency syndromes. The sequences of the genes cloned by Demczuk et al. (1995) and Wadey et al. (1995) are identical.

[13351]

[13352] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13353] Augusseau, S.; Jouk, S.; Jalbert, P.; Prieur, M. : DiGeorge syndrome and 22q11 rearrangements. (Letter) Hum. Genet. 74: 206 only, 1986. ; and

[13354] Demczuk, S.; Aledo, R.; Zucman, J.; Delattre, O.; Desmaze, C.; Dauphinot, L.; Jalbert, P.; Rouleau, G. A.; Thomas, G.; Aurias, A. : Cloning of a balanced translocation breakpoint in the.

[13355] Further studies establishing the function and utilities of DGCR2 are found in John Hopkins OMIM database record ID 600594, and in cited publications listed in Table 5, which are hereby incorporated by reference.Fc fragment of igg, low affinity iib, receptor for (cd32) (FCGR2B, Accession NM_004001.2) is another GAM84 target gene, herein designated TARGET GENE. FCGR2B BINDING SITE1 and FCGR2B BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FCGR2B, corre-

sponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FCGR2B BINDING SITE1 and FCGR2B BINDING SITE2, designated SEQ ID:19509 and SEQ ID:7555 respectively, to the nucleotide sequence of GAM84 RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13356] Another function of GAM84 is therefore inhibition of Fc fragment of igg, low affinity iib, receptor for (cd32) (FCGR2B, Accession NM_004001.2) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCGR2B.

[13357] FLJ11117 (Accession NM_018329.1) is another GAM84 target gene, herein designated TARGET GENE. FLJ11117 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ11117, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ11117 BINDING SITE, designated SEQ ID:6333, to the nucleotide sequence of GAM84 RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13358] Another function of GAM84 is therefore inhibition of

FLJ11117 (Accession NM_018329.1) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11117.

[13359] FLJ20276 (Accession NM_017738.1) is another GAM84 target gene, herein designated TARGET GENE. FLJ20276 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20276, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20276 BINDING SITE, designated SEQ ID:11122, to the nucleotide sequence of GAM84 RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13360] Another function of GAM84 is therefore inhibition of FLJ20276 (Accession NM_017738.1) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20276.

[13361] FLJ30655 (Accession NM_144643.1) is another GAM84 target gene, herein designated TARGET GENE. FLJ30655 BINDING SITE1 and FLJ30655 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ30655, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III

of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ30655 BINDING SITE1 and FLJ30655 BINDING SITE2, designated SEQ ID:6164 and SEQ ID:6278 respectively, to the nucleotide sequence of GAM84 RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13362] Another function of GAM84 is therefore inhibition of FLJ30655 (Accession NM_144643.1) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30655.

[13363] HTRA3 (Accession NM_053044.2) is another GAM84 target gene, herein designated TARGET GENE. HTRA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTRA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HTRA3 BINDING SITE, designated SEQ ID:1600, to the nucleotide sequence of GAM84 RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13364] Another function of GAM84 is therefore inhibition of HTRA3 (Accession NM_053044.2) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with HTRA3.

[13365] KIAA0982 (Accession NM_014023.1) is another GAM84 target gene, herein designated TARGET GENE. KIAA0982 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0982, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0982 BINDING SITE, designated SEQ ID:6334, to the nucleotide sequence of GAM84 RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13366] Another function of GAM84 is therefore inhibition of KIAA0982 (Accession NM_014023.1) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0982.

[13367] LOC127294 (Accession) is another GAM84 target gene, herein designated TARGET GENE. LOC127294 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC127294, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

LOC127294 BINDING SITE, designated SEQ ID:19840, to the nucleotide sequence of GAM84 RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13368] Another function of GAM84 is therefore inhibition of LOC127294 (Accession) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127294.

[13369] LOC133728 (Accession XM_068500.1) is another GAM84 target gene, herein designated TARGET GENE. LOC133728 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC133728, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC133728 BINDING SITE, designated SEQ ID:8467, to the nucleotide sequence of GAM84 RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13370] Another function of GAM84 is therefore inhibition of LOC133728 (Accession XM_068500.1) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133728.

[13371] LOC148918 (Accession XM_086361.5) is another GAM84

target gene, herein designated TARGET GENE. LOC148918 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC148918, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC148918 BINDING SITE, designated SEQ ID:10115, to the nucleotide sequence of GAM84 RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13372] Another function of GAM84 is therefore inhibition of LOC148918 (Accession XM_086361.5) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148918.

[13373] LOC151124 (Accession XM_098006.2) is another GAM84 target gene, herein designated TARGET GENE. LOC151124 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC151124, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC151124 BINDING SITE, designated SEQ ID:2757, to the nucleotide sequence of GAM84 RNA, herein desig-

nated GAM RNA, also designated SEQ ID:204.

[13374] Another function of GAM84 is therefore inhibition of LOC151124 (Accession XM_098006.2) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151124.

[13375] Olfactory receptor, family 2, subfamily c, member 3 (OR2C3, Accession XM_060575.2) is another GAM84 target gene, herein designated TARGET GENE. OR2C3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OR2C3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OR2C3 BINDING SITE, designated SEQ ID:15199, to the nucleotide sequence of GAM84 RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13376] Another function of GAM84 is therefore inhibition of Olfactory receptor, family 2, subfamily c, member 3 (OR2C3, Accession XM_060575.2) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OR2C3.

[13377] 3-oxoacid coa transferase 2 (OXCT2, Accession

NM_022120.1) is another GAM84 target gene, herein designated TARGET GENE. OXCT2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OXCT2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of OXCT2 BINDING SITE, designated SEQ ID:5349, to the nucleotide sequence of GAM84 RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13378] Another function of GAM84 is therefore inhibition of 3-oxoacid coa transferase 2 (OXCT2, Accession NM_022120.1) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OXCT2.

[13379] Ribosomal protein l13a (RPL13A, Accession NM_012423.2) is another GAM84 target gene, herein designated TARGET GENE. RPL13A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RPL13A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of RPL13A BINDING SITE, designated SEQ ID:3006, to the nucleotide sequence of GAM84

RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13380] Another function of GAM84 is therefore inhibition of Ribosomal protein l13a (RPL13A, Accession NM_012423.2) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL13A.

[13381] Thioredoxin 2 (TXN2, Accession NM_012473.3) is another GAM84 target gene, herein designated TARGET GENE. TXN2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TXN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of TXN2 BINDING SITE, designated SEQ ID:12500, to the nucleotide sequence of GAM84 RNA, herein designated GAM RNA, also designated SEQ ID:204.

[13382] Another function of GAM84 is therefore inhibition of Thioredoxin 2 (TXN2, Accession NM_012473.3) . Accordingly, utilities of GAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TXN2.

[13383]

[13384] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 85 (GAM85), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13385] GAM85 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM85 was detected is described hereinabove with reference to Figs. 8-15.

[13386] GAM85 gene, herein designated GAM GENE, and GAM85 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[13387] GAM85 gene encodes a GAM85 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM85 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM85 precursor RNA is designated SEQ ID:182, and is provided hereinbelow with reference to the sequence listing part.

[13388] GAM85 precursor RNA folds onto itself, forming GAM85 folded precursor RNA, herein designated GAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13389] GAM85 precursor RNA folds onto itself, forming GAM85 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[13390] Nucleotide sequence of GAM85 precursor RNA, designated SEQ-ID: 182, and a schematic representation of a predicted secondary folding of GAM85 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[13391] An enzyme complex designated DICER COMPLEX, `dices` the GAM85 folded precursor RNA into GAM85 RNA, herein

designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM85 RNA is designated SEQ ID:227, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[13392] GAM85 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM85 target RNA, herein designated GAM TARGET RNA. GAM85 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13393] GAM85 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM85 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM85 RNA is an accurate or a partial inversed-reversed se-

quence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM85 RNA may have a different number of target binding sites in untranslated regions of a GAM85 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13394] The complementary binding of GAM85 RNA, herein designated GAM RNA, to target binding sites on GAM85 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM85 target RNA into GAM85 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13395] It is appreciated that GAM85 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM85 target genes. The mRNA of each one of this plu-

rality of GAM85 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM85 RNA, herein designated GAM RNA, and which when bound by GAM85 RNA causes inhibition of translation of respective one or more GAM85 target proteins.

[13396] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM85 gene, herein designated GAM GENE, on one or more GAM85 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13397] It is appreciated that specific functions and accordingly

utilities of GAM85 correlate with, and may be deduced from, the identity of the target genes which GAM85 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13398]

[13399]

[13400] DKFZP434B044 (Accession NM_031476.1) is a GAM85 target gene, herein designated TARGET GENE. DKFZP434B044 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434B044, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434B044 BINDING SITE, designated SEQ ID:7457, to the nucleotide sequence of GAM85 RNA, herein designated GAM RNA, also designated SEQ ID:227.

[13401] A function of GAM85 is therefore inhibition of DKFZP434B044 (Accession NM_031476.1) . Accordingly, utilities of GAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B044.

[13402] Protocadherin gamma subfamily a, 6 (PCDHGA6, Accession NM_018919.2) is another GAM85 target gene, herein designated TARGET GENE. PCDHGA6 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PCDHGA6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PCDHGA6 BINDING SITE, designated SEQ ID:13203, to the nucleotide sequence of GAM85 RNA, herein designated GAM RNA, also designated SEQ ID:227.

[13403] Another function of GAM85 is therefore inhibition of Protocadherin gamma subfamily a, 6 (PCDHGA6, Accession NM_018919.2) . Accordingly, utilities of GAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHGA6.

[13404] Protein serine kinase h1 (PSKH1, Accession NM_006742.1) is another GAM85 target gene, herein designated TARGET GENE. PSKH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PSKH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide se-

quences of PSKH1 BINDING SITE, designated SEQ ID:9017, to the nucleotide sequence of GAM85 RNA, herein designated GAM RNA, also designated SEQ ID:227.

[13405] Another function of GAM85 is therefore inhibition of Protein serine kinase h1 (PSKH1, Accession NM_006742.1) . Accordingly, utilities of GAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSKH1.

[13406]

[13407] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 86 (GAM86), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13408] GAM86 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM86 was detected is described hereinabove with reference to Figs. 8-15.

[13409] GAM86 gene, herein designated GAM GENE, and GAM86 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[13410] GAM86 gene encodes a GAM86 precursor RNA, herein

designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM86 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM86 precursor RNA is designated SEQ ID:56, and is provided hereinbelow with reference to the sequence listing part.

[13411] GAM86 precursor RNA folds onto itself, forming GAM86 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13412] GAM86 precursor RNA folds onto itself, forming GAM86 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[13413] Nucleotide sequence of GAM86 precursor RNA, designated SEQ-ID: 56, and a schematic representation of a predicted secondary folding of GAM86 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[13414] An enzyme complex designated DICER COMPLEX, `dices` the GAM86 folded precursor RNA into GAM86 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM86 RNA is designated SEQ ID:382, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[13415] GAM86 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM86 target RNA, herein designated GAM TARGET RNA. GAM86 target RNA comprises three regions, as is typical of mRNA of a

protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13416] GAM86 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM86 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM86 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM86 RNA may have a different number of target binding sites in untranslated regions of a GAM86 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13417] The complementary binding of GAM86 RNA, herein desig-

nated GAM RNA, to target binding sites on GAM86 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM86 target RNA into GAM86 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13418] It is appreciated that GAM86 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM86 target genes. The mRNA of each one of this plurality of GAM86 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM86 RNA, herein designated GAM RNA, and which when bound by GAM86 RNA causes inhibition of translation of respective one or more GAM86 target proteins.

[13419] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM86 gene, herein designated GAM GENE, on one or more GAM86 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary bind-

ing site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13420] It is appreciated that specific functions and accordingly utilities of GAM86 correlate with, and may be deduced from, the identity of the target genes which GAM86 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13421]

[13422]

[13423] FLJ20340 (Accession) is a GAM86 target gene, herein designated TARGET GENE. FLJ20340 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ20340, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ20340 BIND-

ING SITE, designated SEQ ID:15070, to the nucleotide sequence of GAM86 RNA, herein designated GAM RNA, also designated SEQ ID:382.

[13424] A function of GAM86 is therefore inhibition of FLJ20340 (Accession) . Accordingly, utilities of GAM86 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20340.

[13425]

[13426] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 87 (GAM87), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13427] GAM87 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM87 was detected is described hereinabove with reference to Figs. 8-15.

[13428] GAM87 gene, herein designated GAM GENE, and GAM87 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[13429] GAM87 gene encodes a GAM87 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA

genes, and unlike most ordinary genes, GAM87 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM87 precursor RNA is designated SEQ ID:120, and is provided hereinbelow with reference to the sequence listing part.

[13430] GAM87 precursor RNA folds onto itself, forming GAM87 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13431] GAM87 precursor RNA folds onto itself, forming GAM87 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nu-

cleotide sequence of the second half thereof.

[13432] Nucleotide sequence of GAM87 precursor RNA, designated SEQ-ID: 120, and a schematic representation of a predicted secondary folding of GAM87 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[13433] An enzyme complex designated DICER COMPLEX, `dices` the GAM87 folded precursor RNA into GAM87 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: C) nucleotide sequence of GAM87 RNA is designated SEQ ID:366, and is provided hereinbelow with references to the sequence listing part and Table 3, hereby incorporated by reference.

[13434] GAM87 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM87 target RNA, herein designated GAM TARGET RNA. GAM87 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein

coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13435] GAM87 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM87 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM87 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM87 RNA may have a different number of target binding sites in untranslated regions of a GAM87 target RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13436] The complementary binding of GAM87 RNA, herein designated GAM RNA, to target binding sites on GAM87 target

RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM87 target RNA into GAM87 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13437] It is appreciated that GAM87 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM87 target genes. The mRNA of each one of this plurality of GAM87 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM87 RNA, herein designated GAM RNA, and which when bound by GAM87 RNA causes inhibition of translation of respective one or more GAM87 target proteins.

[13438] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM87 gene, herein designated GAM GENE, on one or more GAM87 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the

known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13439] It is appreciated that specific functions and accordingly utilities of GAM87 correlate with, and may be deduced from, the identity of the target genes which GAM87 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13440]

[13441]

[13442] Adam-like, decysin 1 (ADAMDEC1, Accession NM_014479.2) is a GAM87 target gene, herein designated TARGET GENE. ADAMDEC1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAMDEC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of ADAMDEC1 BINDING SITE,

designated SEQ ID:3369, to the nucleotide sequence of GAM87 RNA, herein designated GAM RNA, also designated SEQ ID:366.

[13443] A function of GAM87 is therefore inhibition of Adam-like, decysin 1 (ADAMDEC1, Accession NM_014479.2) . Accordingly, utilities of GAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMDEC1.

[13444] KIAA0663 (Accession NM_014827.1) is another GAM87 target gene, herein designated TARGET GENE. KIAA0663 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA0663, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA0663 BINDING SITE, designated SEQ ID:2132, to the nucleotide sequence of GAM87 RNA, herein designated GAM RNA, also designated SEQ ID:366.

[13445] Another function of GAM87 is therefore inhibition of KIAA0663 (Accession NM_014827.1) . Accordingly, utilities of GAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0663.

[13446] KIAA1571 (Accession XM_027744.1) is another GAM87 target gene, herein designated TARGET GENE. KIAA1571 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1571, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1571 BINDING SITE, designated SEQ ID:15798, to the nucleotide sequence of GAM87 RNA, herein designated GAM RNA, also designated SEQ ID:366.

[13447] Another function of GAM87 is therefore inhibition of KIAA1571 (Accession XM_027744.1) . Accordingly, utilities of GAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1571.

[13448] KIAA1677 (Accession XM_040383.5) is another GAM87 target gene, herein designated TARGET GENE. KIAA1677 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by KIAA1677, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KIAA1677 BINDING SITE, designated SEQ ID:10201, to the

nucleotide sequence of GAM87 RNA, herein designated GAM RNA, also designated SEQ ID:366.

[13449] Another function of GAM87 is therefore inhibition of KIAA1677 (Accession XM_040383.5) . Accordingly, utilities of GAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1677.

[13450] LOC91050 (Accession) is another GAM87 target gene, herein designated TARGET GENE. LOC91050 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC91050, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC91050 BINDING SITE, designated SEQ ID:7289, to the nucleotide sequence of GAM87 RNA, herein designated GAM RNA, also designated SEQ ID:366.

[13451] Another function of GAM87 is therefore inhibition of LOC91050 (Accession) . Accordingly, utilities of GAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91050.

[13452] Platelet derived growth factor c (PDGFC, Accession NM_016205.1) is another GAM87 target gene, herein des-

ignated TARGET GENE. PDGFC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PDGFC, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of PDGFC BINDING SITE, designated SEQ ID:2292, to the nucleotide sequence of GAM87 RNA, herein designated GAM RNA, also designated SEQ ID:366.

[13453] Another function of GAM87 is therefore inhibition of Platelet derived growth factor c (PDGFC, Accession NM_016205.1) . Accordingly, utilities of GAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFC.

[13454]

[13455] Fig. 8 further provides a conceptual description of a novel bioinformatically detected of the present invention, referred to here as Genomic Address Messenger 88 (GAM88), which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[13456] GAM88 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM88 was detected is described hereinabove

with reference to Figs. 8-15.

[13457] GAM88 gene, herein designated GAM GENE, and GAM88 target gene, herein designated TARGET GENE, are human genes contained in the human genome.

[13458] GAM88 gene encodes a GAM88 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM88 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM88 precursor RNA is designated SEQ ID:178, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:178 is located at position 26570785 relative to chromosome 13.

[13459] GAM88 precursor RNA folds onto itself, forming GAM88 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13460] GAM88 precursor RNA folds onto itself, forming GAM88

folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial reverse-complementary sequence of the nucleotide sequence of the second half thereof.

[13461] Nucleotide sequence of GAM88 precursor RNA, designated SEQ-ID: 178, and a schematic representation of a predicted secondary folding of GAM88 folded precursor RNA are further described with reference to Table 2, hereby incorporated by reference.

[13462] An enzyme complex designated DICER COMPLEX, `dices` the GAM88 folded precursor RNA into GAM88 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (GAM Prediction Accuracy Group: B) nucleotide sequence of GAM88 RNA is designated SEQ ID:310, and is provided hereinbelow with references to the

sequence listing part and Table 3, hereby incorporated by reference.

[13463] GAM88 target gene, herein designated TARGET GENE, encodes a corresponding messenger RNA, GAM88 target RNA, herein designated GAM TARGET RNA. GAM88 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13464] GAM88 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM88 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM88 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM88 RNA may have a different number of target binding sites in untranslated regions of a GAM88 target

RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3`UTR region, this is meant as an example only these target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13465] The complementary binding of GAM88 RNA, herein designated GAM RNA, to target binding sites on GAM88 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM88 target RNA into GAM88 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[13466] It is appreciated that GAM88 target gene, herein designated TARGET GENE, in fact represents a plurality of GAM88 target genes. The mRNA of each one of this plurality of GAM88 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM88 RNA, herein designated GAM RNA, and which when bound by GAM88 RNA causes inhibition of translation of respective one or more GAM88 target proteins.

[13467] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with

specific reference to translational inhibition exerted by GAM88 gene, herein designated GAM GENE, on one or more GAM88 target genes, herein collectively designated TARGET GENE, is common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13468] It is appreciated that specific functions and accordingly utilities of GAM88 correlate with, and may be deduced from, the identity of the target genes which GAM88 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13469]

[13470]

[13471] AIP1 (Accession NP_036433.2) is a GAM88 target gene,

herein designated TARGET GENE. AIP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by AIP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of AIP1 BINDING SITE, designated SEQ ID:19267, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13472] A function of GAM88 is therefore inhibition of AIP1 (Accession NP_036433.2) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AIP1.

[13473] Bcl2-like 12 (proline rich) (BCL2L12, Accession NP_443074.2) is another GAM88 target gene, herein designated TARGET GENE. BCL2L12 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BCL2L12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL2L12 BINDING SITE, designated SEQ ID:2744, to the nucleotide sequence of GAM88 RNA, herein designated

GAM RNA, also designated SEQ ID:310.

[13474] Another function of GAM88 is therefore inhibition of Bcl2-like 12 (proline rich) (BCL2L12, Accession NP_443074.2) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L12.

[13475] Bcl2-like 12 (proline rich) (BCL2L12, Accession NP_619580.1) is another GAM88 target gene, herein designated TARGET GENE. BCL2L12 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BCL2L12, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of BCL2L12 BINDING SITE, designated SEQ ID:2744, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13476] Another function of GAM88 is therefore inhibition of Bcl2-like 12 (proline rich) (BCL2L12, Accession NP_619580.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L12.

[13477] Chromosome 18 open reading frame 1 (C18orf1, Acces-

sion NP_004329.1) is another GAM88 target gene, herein designated TARGET GENE. C18orf1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by C18orf1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of C18orf1 BINDING SITE, designated SEQ ID:1225, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13478] Another function of GAM88 is therefore inhibition of Chromosome 18 open reading frame 1 (C18orf1, Accession NP_004329.1), a gene which displays selective expression, regulated spatially and temporally. Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C18orf1.

[13479] The function of C18orf1 has been established by previous studies. By cDNA selection, Yoshikawa et al. (1997) isolated several brain- derived transcripts on chromosome 18, including C18ORF1, which maps to 18p11.2. Yoshikawa et al. (1998) further characterized C18ORF1 and identified 2 major classes of transcripts distinguished

by their unique upstream regions, with the beta variants representing N- terminal- truncated versions of the alpha isoforms. The alpha- specific exons 1 to 3 are missing in beta; instead, the downstream sequence of intron C is present in the mature mRNA (exon 4a), which combines with exon 4b to create the upstream exon for beta. The differential splicing of exon 5 leads to the expression of 2 alpha and 2 beta subclasses. Alpha- 1 and beta- 1 share identical sequences with alpha- 2 and beta- 2, respectively, except for the loss of exon 5 in alpha- 2 and beta- 2. The differences between the alpha and the beta classes of transcripts predict 2 potentially distinct promoters for the C18ORF1 gene. Yoshikawa et al. (1998) also presented evidence of RNA editing in the 5- prime untranslated region of the beta- 2 variant. Yoshikawa et al. (1998) demonstrated that the C18ORF1 transcripts display selective expression, regulated spatially and temporally. The cortical and subcortical structures of brain appear to express high levels of alpha, in both fetal and adult stages. The major 9- kb transcript of C18ORF1, detectable in early development in kidney, liver, and lung, is indiscernible in these tissues in the adult. The expression profile displayed by beta is more complex. Northern blots

generated from adult tissues are devoid of hybridization signals with beta but fetal tissues exhibit a 4- kb transcript. In contrast, all subcortical areas of adult brain show relatively intense signals at 6.8 kb, implying a different mechanism of transcript processing in adult brain structures. Northern blot analysis also detected several minor bands in the alpha and beta isoforms.

[13480]

[13481] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13482] Yoshikawa, T.; Sanders, A. R.; Esterling, L. E.; Detera-Wadleigh, S. D. : Multiple transcriptional variants and RNA editing in C18orf1, a novel gene with LDLRA and transmembrane domains on 18p11.2. Genomics 47: 246- 257, 1998. ; and

[13483] Yoshikawa, T.; Sanders, A. R.; Esterling, L. E.; Overharser, J.; Garnes, J. A.; Lennon, G.; Grewal, R.; Detera- Wadleigh, S. D. : Isolation of chromosome 18- specific brain transcripts as.

[13484] Further studies establishing the function and utilities of C18orf1 are found in John Hopkins OMIM database record ID 606571, and in cited publications listed in Table 5,

which are hereby incorporated by reference.Calcium channel, voltage-dependent, l type, alpha 1s subunit (CACNA1S, Accession NP_000060.1) is another GAM88 target gene, herein designated TARGET GENE. CACNA1S BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CACNA1S, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of CACNA1S BINDING SITE, designated SEQ ID:476, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13485] Another function of GAM88 is therefore inhibition of Calcium channel, voltage-dependent, l type, alpha 1s subunit (CACNA1S, Accession NP_000060.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNA1S.

[13486] D15Wsu75e (Accession XP_039495.1) is another GAM88 target gene, herein designated TARGET GENE. D15Wsu75e BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by D15Wsu75e, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 il-

lustrates the complementarity of the nucleotide sequences of D15Wsu75e BINDING SITE, designated SEQ ID:15739, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13487] Another function of GAM88 is therefore inhibition of D15Wsu75e (Accession XP_039495.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D15Wsu75e.

[13488] DKFZP434P211 (Accession NP_055364.1) is another GAM88 target gene, herein designated TARGET GENE. DKFZP434P211 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DKFZP434P211, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP434P211 BINDING SITE, designated SEQ ID:13554, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13489] Another function of GAM88 is therefore inhibition of DKFZP434P211 (Accession NP_055364.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with DKFZP434P211.

[13490] DKFZP762N2316 (Accession XP_040560.4) is another GAM88 target gene, herein designated TARGET GENE. DKFZP762N2316 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by DKFZP762N2316, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of DKFZP762N2316 BINDING SITE, designated SEQ ID:18171, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13491] Another function of GAM88 is therefore inhibition of DKFZP762N2316 (Accession XP_040560.4) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP762N2316.

[13492] FLJ13105 (Accession XP_291109.1) is another GAM88 target gene, herein designated TARGET GENE. FLJ13105 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FLJ13105, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ13105 BINDING SITE, designated SEQ ID:5327, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13493] Another function of GAM88 is therefore inhibition of FLJ13105 (Accession XP_291109.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13105.

[13494] FLJ21458 (Accession NP_079126.1) is another GAM88 target gene, herein designated TARGET GENE. FLJ21458 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ21458, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ21458 BINDING SITE, designated SEQ ID:2930, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13495] Another function of GAM88 is therefore inhibition of FLJ21458 (Accession NP_079126.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21458.

[13496] FLJ22578 (Accession NP_079140.1) is another GAM88 target gene, herein designated TARGET GENE. FLJ22578 BINDING SITE1 and FLJ22578 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLJ22578, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ22578 BINDING SITE1 and FLJ22578 BINDING SITE2, designated SEQ ID:12117 and SEQ ID:16393 respectively, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13497] Another function of GAM88 is therefore inhibition of FLJ22578 (Accession NP_079140.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22578.

[13498] FLJ30794 (Accession NP_689740.1) is another GAM88 target gene, herein designated TARGET GENE. FLJ30794 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ30794, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of

FLJ30794 BINDING SITE, designated SEQ ID:885, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13499] Another function of GAM88 is therefore inhibition of FLJ30794 (Accession NP_689740.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30794.

[13500] FLJ34233 (Accession NP_775965.1) is another GAM88 target gene, herein designated TARGET GENE. FLJ34233 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLJ34233, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of FLJ34233 BINDING SITE, designated SEQ ID:2585, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13501] Another function of GAM88 is therefore inhibition of FLJ34233 (Accession NP_775965.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ34233.

[13502] Glucocorticoid induced transcript 1 (GLCCI1, Accession XP_166529.2) is another GAM88 target gene, herein des-

ignated TARGET GENE. GLCCI1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GLCCI1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of GLCCI1 BINDING SITE, designated SEQ ID:10955, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13503] Another function of GAM88 is therefore inhibition of Glucocorticoid induced transcript 1 (GLCCI1, Accession XP_166529.2) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLCCI1.

[13504] Hydroxymethylbilane synthase (HMBS, Accession NP_000181.2) is another GAM88 target gene, herein designated TARGET GENE. HMBS BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HMBS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of HMBS BINDING SITE, designated SEQ ID:12118, to the nucleotide sequence of GAM88 RNA,

herein designated GAM RNA, also designated SEQ ID:310.

[13505] Another function of GAM88 is therefore inhibition of Hydroxymethylbilane synthase (HMBS, Accession NP_000181.2) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMBS.

[13506] Janus kinase 3 (a protein tyrosine kinase, leukocyte) (JAK3, Accession NP_000206.1) is another GAM88 target gene, herein designated TARGET GENE. JAK3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by JAK3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of JAK3 BINDING SITE, designated SEQ ID:10674, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13507] Another function of GAM88 is therefore inhibition of Janus kinase 3 (a protein tyrosine kinase, leukocyte) (JAK3, Accession NP_000206.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAK3.

[13508] Potassium large conductance calcium-activated channel,

subfamily m, beta member 2 (KCNMB2, Accession NP_852006.1) is another GAM88 target gene, herein designated TARGET GENE. KCNMB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNMB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNMB2 BINDING SITE, designated SEQ ID:6564, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13509] Another function of GAM88 is therefore inhibition of Potassium large conductance calcium-activated channel, subfamily m, beta member 2 (KCNMB2, Accession NP_852006.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNMB2.

[13510] Potassium large conductance calcium-activated channel, subfamily m, beta member 2 (KCNMB2, Accession NP_005823.1) is another GAM88 target gene, herein designated TARGET GENE. KCNMB2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by KCNMB2, corre-

sponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of KCNMB2 BINDING SITE, designated SEQ ID:6564, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13511] Another function of GAM88 is therefore inhibition of Potassium large conductance calcium-activated channel, subfamily m, beta member 2 (KCNMB2, Accession NP_005823.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNMB2.

[13512] LOC123722 (Accession XP_058721.2) is another GAM88 target gene, herein designated TARGET GENE. LOC123722 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC123722, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC123722 BINDING SITE, designated SEQ ID:10477, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13513] Another function of GAM88 is therefore inhibition of

LOC123722 (Accession XP_058721.2) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123722.

[13514] LOC149073 (Accession XP_097577.1) is another GAM88 target gene, herein designated TARGET GENE. LOC149073 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC149073, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC149073 BINDING SITE, designated SEQ ID:11398, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13515] Another function of GAM88 is therefore inhibition of LOC149073 (Accession XP_097577.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149073.

[13516] LOC150174 (Accession XP_086802.2) is another GAM88 target gene, herein designated TARGET GENE. LOC150174 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150174, cor-

responding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150174 BINDING SITE, designated SEQ ID:13554, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13517] Another function of GAM88 is therefore inhibition of LOC150174 (Accession XP_086802.2) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150174.

[13518] LOC150213 (Accession XP_059324.1) is another GAM88 target gene, herein designated TARGET GENE. LOC150213 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC150213, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC150213 BINDING SITE, designated SEQ ID:13554, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13519] Another function of GAM88 is therefore inhibition of LOC150213 (Accession XP_059324.1) . Accordingly, utili-

ties of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150213.

[13520] LOC153387 (Accession XP_098369.1) is another GAM88 target gene, herein designated TARGET GENE. LOC153387 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC153387, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC153387 BINDING SITE, designated SEQ ID:17717, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13521] Another function of GAM88 is therefore inhibition of LOC153387 (Accession XP_098369.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153387.

[13522] LOC154222 (Accession XP_098497.1) is another GAM88 target gene, herein designated TARGET GENE. LOC154222 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC154222, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC154222 BINDING SITE, designated SEQ ID:18214, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13523] Another function of GAM88 is therefore inhibition of LOC154222 (Accession XP_098497.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154222.

[13524] LOC157627 (Accession XP_088347.2) is another GAM88 target gene, herein designated TARGET GENE. LOC157627 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC157627, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC157627 BINDING SITE, designated SEQ ID:10850, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13525] Another function of GAM88 is therefore inhibition of LOC157627 (Accession XP_088347.2) . Accordingly, utilities of GAM88 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC157627.

[13526] LOC201173 (Accession XP_113312.3) is another GAM88 target gene, herein designated TARGET GENE. LOC201173 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LOC201173, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC201173 BINDING SITE, designated SEQ ID:18000, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13527] Another function of GAM88 is therefore inhibition of LOC201173 (Accession XP_113312.3) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201173.

[13528] LOC254826 (Accession XP_173188.1) is another GAM88 target gene, herein designated TARGET GENE. LOC254826 BINDING SITE1 and LOC254826 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LOC254826, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING

SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC254826 BINDING SITE1 and LOC254826 BINDING SITE2, designated SEQ ID:14223 and SEQ ID:15375 respectively, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13529] Another function of GAM88 is therefore inhibition of LOC254826 (Accession XP_173188.1) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254826.

[13530] LOC256447 (Accession XP_170877.1) is another GAM88 target gene, herein designated TARGET GENE. LOC256447 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC256447, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC256447 BINDING SITE, designated SEQ ID:12508, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13531] Another function of GAM88 is therefore inhibition of LOC256447 (Accession XP_170877.1) . Accordingly, utili-

ties of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256447.

[13532] LOC283244 (Accession XP_208583.2) is another GAM88 target gene, herein designated TARGET GENE. LOC283244 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283244, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283244 BINDING SITE, designated SEQ ID:9088, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.

[13533] Another function of GAM88 is therefore inhibition of LOC283244 (Accession XP_208583.2) . Accordingly, utilities of GAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC283244.

[13534] LOC283911 (Accession XP_211259.2) is another GAM88 target gene, herein designated TARGET GENE. LOC283911 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LOC283911, corresponding to a target binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III of Fig.8. Table 4 illustrates the complementarity of the nucleotide sequences of LOC283911 BINDING SITE, designated SEQ ID:11156, to the nucleotide sequence of GAM88 RNA, herein designated GAM RNA, also designated SEQ ID:310.
